SUMMARY AND CONCLUSIONS 16

LIST OF APPENDICES

Foreward

In 1994, the Department of Finance's Economics and Statistics Branch began closely monitoring demographic changes that were already becoming of some concern. Out-migration began increasing in that year, and by 1996 it was clear that changes were going to have lasting impacts on the province. Since demographic change was such a vitally important issue affecting the province, in 1998/99 the Economics and Statistics Branch, as the central agency responsible for meeting the broad macroeconomic and statistical requirements of the Government of Newfoundland and Labrador and its agencies, initiated a formalized, comprehensive study of the issue.

The Province's demographic study sought to examine the underlying causes of demographic change and to anticipate future demographic changes and, in particular, what they might mean for the future of Newfoundland and Labrador. Among other things, the study would provide an understanding of the extent to which demographic trends could affect the future size, age structure and regional distribution of the population.

The regional component was viewed as being particularly important because of the uncertainties related to the future geographic distribution of the province's population. Clearly, it would not be enough to know how many people would be living in the province, rather information is also needed about where the population will be living in order to facilitate strategic planning and development in the areas of public service provision and regional economic development.

With this in mind, and also in view of the wide divergence of opinions among various agencies (e.g., Conference Board of Canada and Statistics Canada), a consultative approach to developing long term population projections was viewed as the most effective approach to accomplishing certain of the Study's objectives. The Atlantic Canada Opportunities Agency had expressed an interest in the province's Demographic Study, particularly in the regional component, and was offered a partnership in the public consultations that would result in regional population projections.

The joint project afforded an opportunity to build a consensus between the two levels of government on a base case set of population projections for the province, and also to develop a set of sub-provincial projections along zone boundary lines. There was also a desire to engage regional interest groups in a discussion of demographic trends.

The consultations took about a year to complete, mainly because of logistics with scheduling. This report marks the conclusion of the consultation and documents its process and results. Readers should note that all data used throughout this report, other than population projections, is from Statistics Canada as of April 2001 unless otherwise indicated.

DEMOGRAPHIC TRENDS AND PROJECT BACKGROUND

Within a single generation, Newfoundland and Labrador has gone from having the highest fertility rates in the Country to the lowest. In addition, the province has typically had the highest rates of net out-migration, with young people leaving their home communities to further their education and/or to seek employment. As a result of falling births and out-migration, generally of young people, Newfoundland's population has aged much more rapidly than Canada's over the last 30 years. In conjunction with aging, the number of deaths increased such that we are now at a point of zero, and even negative, natural population change (births minus deaths). The net result of declining births, rising deaths and relatively high levels of net out-migration throughout most of the 1990s was a 41,400 or 7.1% population decline from 1993 to 2000.

The demographic geography of the province is also changing. Population has declined in all regions since 1993 but the pattern of decline has been uneven, with fishery-dependent rural regions disproportionately impacted. Different rates of population decline across regions are largely explained by differences in out-migration rates, particularly out-migration of youth. Generally speaking, the extent of population decline and youth out-migration during the 1990s were highest in fishery dependent regions where the economic and social environment was most greatly impacted by the groundfish moratorium and UI/EI restructuring. Although the declines projected for the province's total population in the coming years are relatively modest, important geographic population shifts are projected to be ongoing, and rates of population aging are expected to continue diverging across regions.

Many of these demographic trends, particularly aging and inter-regional population shifts, are projected to continue for at least another decade or so. Since demographic trends are long-term in nature, it is important to have a reasonable set of long-term demographic projections to assist in the planning, policy and program areas. Regional population projections were deemed to be particularly important, and a consultative approach to developing long term projections was viewed as the most effective approach.

The Atlantic Canada Opportunities Agency had expressed an interest in the province's ongoing Demographic Study, and was offered a partnership in the regional consultation component in return for a contribution towards the overall cost. The consultation process was carried out in partnership between the provincial *Department of Finance* and the federal *Atlantic Canada Opportunities Agency*. The complete text of the agreement between the federal and provincial governments is contained in Appendix 1. Bev Carter (NF Finance) and Don Hogan (ACOA) advised on overall direction of the project. Dr. Doug May (MUN) was engaged to provide independent technical advice/support to the project, as well as coordination of the consultations. Patti Powers provided research assistance to the project.

The project took over a year to complete, mainly because of logistics with scheduling regional consultations. This report marks the conclusion of the joint project and documents the process by which its objectives, as set out in the proposal (see Appendix 1), were achieved .

ECONOMIC AND DEMOGRAPHIC PROJECTIONS

Parts I and II of the proposal called for the development of a set of three economic/demographic scenarios for Newfoundland and Labrador, with high, medium and low probabilities attached. As called for in the proposal, these scenarios varied mainly, though not entirely, along major project lines (e.g., oil & gas, mining, etc.)" and were built up around a set of assumptions that were generally agreed upon between ACOA and provincial Finance. The resulting scenarios are not, nor were they intended to be, a *view of the world* forecast (i.e., here's how we think the future will unfold) but rather *what would happen if* projections based on the specific set of assumptions/inputs agreed upon.

These economic/demographic scenarios were developed using the Department of Finance's models, but utilizing agreed upon assumptions. A summary of the methodology and key assumptions is provided below while details are contained in Appendix 2.

Methodology and Assumptions

The key issues for Newfoundland and Labrador's long-term economic outlook revolve around assumptions for mega projects such as future oil developments, Voisey's Bay and Labrador Power and assumptions for future labour productivity (output per worker) growth. Other important factors include the outlook for current resource industries, assumptions for real wage growth, population levels, and issues surrounding future labour supply including age and gender specific labour participation rates and the unemployment rate. All of these factors were varied across all three economic scenarios. The methodology and agreed upon assumptions are outlined in detail in Appendix 2, while a summary is provided below.

Mega Project Assumptions

Eight major projects were considered, and assumptions regarding the inclusion and/or timing of the these projects were varied across the low, medium and high scenarios, as summarized in the following table (see Appendix 2 for additional details).

Potential Mega Projects

Projects	Low	Medium	High
Voisey's Bay	L[1]	M	H
Labrador Power		M	H
Terra Nova	L	M	H
Whiterose	L	M	H
Hebron/Ben Nevis		M	H
Undiscovered Oil 1		M	H
Undiscovered Oil 2			H
Gas Project		M[2]	H[3]

[1] Surface ovoid portion only. [2] Starts in 2015 [3] Starts in 2011

Major Industry Assumptions
Next a set of assumptions regarding current industries operating in the Province were developed. For example, it was assumed in all three scenarios that real GDP in the retail trade industry would grow in line with real consumer spending and real GDP in the newsprint industry would remain stable at current levels. Assumptions for major provincial industries are provided in Appendix 2.

Output Per Worker Growth
Another important determinant of future labour demand is labour productivity or output per worker trends in the future. The assumptions used in each of the three scenarios, together with historical growth rates for Canada, the United States and Newfoundland and Labrador, are provided in Appendix 2. In general, historical growth rates have varied and the assumptions made in this area have significant implications for labour requirements projections.

Real Wages
Real wage rates for each industry were assumed to grow by a minimum of one percent per year. For industries where growth in output per worker is stronger than one percent per year, real wages were assumed to grow in line with real output per worker.

Labour Force
Once real output, employment, and wage rate growth were determined the economic forecast was nearly complete. The final pieces to complete the process are assumptions regarding participation rates (age specific participation rates) and the unemployment rate. Once these two factors are determined, then labour force and the population levels required to supply the labour force can be estimated.

The seasonal nature of many industries, and thus the over dependence on seasonal employment in Newfoundland and Labrador is a major reason why participation rates are lower than in either Canada or the US. The gaps were assumed to close, to some extent, over the forecast period.

Assumptions about the change in age-specific participation rates over the forecast period are summarized in the table below. For example, in the medium case, current age specific participation rates are assumed to increase gradually such that by 2020 one half of the current gap between Newfoundland and Canada would be eliminated. For the 55 to 64 age group, the gap between Newfoundland and the US gap was used as the benchmark.

Participation Rates by Age and Gender
Assumptions for End of Projection Period

Low	Increase by 25% of 2000 Can-NF Gap*
Medium	Increase by 50% of 2000 Can-NF Gap*
High	Increase by 75% of 2000 Can-NF Gap*

* Uses NF-US gap for 55 to 64 year age group.

Economic Scenarios
The various combinations of assumptions produced three economic scenarios with differing labour force and population requirements in 2016, as summarized in the table below.

Economic Scenarios: Main Indicators 2000 and 2016

	Actual Value in 2000[1]	Projected Value of Indicator in 2016		
		Low	Medium	High
Real GDP ($92 Millions)	11,852	13,618	15,230	15,952
Compound Growth	2.3%	0.87%	1.58%	1.87%
Employment ('000s)	204.6	189	208	229
Compound Growth	1.0%	-.048%	0.11%	0.70%
Unemployment Rate (%)	16.7	15.1	12.2	11.3
Labour Force ('000s)	245.6	223	237	258
Compound Growth	1.2%	-0.6.%	-0.2%	0.3%
Population	538.8	496.4	514.2	532.2
Compound Growth	-0.2%	-0.5%	-0.3%	-0.1%
Average Output/PY ($92)	57,928	71,939	73,186	69,751
Compound Growth	1.2%	1.36%	1.47%	1.17%
Total Fertility Rate (TFR)	1.27	Trend to 1.0	Constant 1.27	Trend to 1.4

[1] Percent Change is average compound growth rate from 1976 to 2000.

The demographic scenarios based on these economic scenarios were developed by choosing three alternative fertility rate assumptions, and three alternative life expectancy assumptions and combining them with the economic scenarios. Through an iterative process between the Department of Finance's population projection model, POPPS, and NALEM, the population projections and the economic projections were adjusted back and forth, via net-migration in POPPS and via total population in NALEM, until the two were consistent. Details of the provincial population projections are provided in Appendices 8, 9 and10 while a summary is provided in the table below:

Scenario	Assumptions	Population in 2016	% Change 2000-2016[1]
Low	No new oil developments beyond Whiterose. Voisey's Bay development restricted to surface ovoid portion only; and no hydro developments in Labrador are assumed. Status quo is assumed for the rest of economy.	496,410	-7.9%
Medium	Low scenario assumptions plus Hebron-Ben Nevis and one other oil field development are assumed; full development of Voisey's Bay including underground mining and a smelter in the province; gas developed offshore starting in 2015; Labrador power is developed.	514,200	-4.6%
High	Medium case plus one other oil field; gas developed by 2011.	532,190	-1.2%

[1] Calculations based on Statistics Canada's estimated population of 538,823 in 2000.
Note: Assumptions are outlined more fully in Appendix 2.

All three scenarios were developed in an integrated framework to ensure consistency between the economic projections and corresponding population projections. The economic projections were necessary to take into account future labour supply and demand issues and how this could reasonably be expected to translate into future migration trends. This approach recognized the fact that economic and demographic developments are closely interrelated. Economic activity influences demographic developments mainly (and directly) through the migration component of population change, but could also influence natural population change (both directly and indirectly).

All of the scenarios call for a decline in population for Newfoundland and Labrador to 2016. The medium scenario suggests a gradual population loss to about 514 thousand by 2016. This 4.6% decrease follows a 7.1% decline from 1993 to 2000, suggesting a slowdown in the rate of out-migration, with positive migration numbers beyond 2006. The projections are consistent with Statistics Canada's base case and reflects the views of those who participated in the consultations. The medium scenario most closely coincides with what we heard during our consultation process with the regions.

REGIONAL CONSULTATION AND POPULATION PROJECTIONS

Part III of the proposal governing the joint work called for a set of three demographic projections by Economic Zone. These projections would be constrained to add up to those for the total province (i.e., as per Part II of project proposal), and thus would be consistent with the economic scenarios and agreed upon assumptions developed in Part I of the project. At the same time, however, the study group was reluctant to simply allocate the total population based historical shares but rather sought to ensure the sub-provincial regional projections were well-informed and incorporated the views of knowledgeable people in the regions. In this regard, information/intelligence was gathered through a series of regional consultations conducted through provincial *Strategic Social Plan* boards. These consultations provided the mechanism by which the assumptions underlying regional population projections were examined by people in the respective region, and by which feedback was obtained and used to *fine tune* the projections which are presented in a subsequent section of this report.

PANEL OF EXPERT CONSULTATION

Part IV of the proposal called for a non-binding review of the economic/demographic projections through consultation with a Panel of Experts. The objective of this consultation stemmed from the outlook for total provincial population and the wide disparity of views which had existed for the past number of years between the Government of Newfoundland and Labrador and other agencies such as Statistics Canada and the Conference Board of Canada, as well as nationally recognized experts from the academic community (e.g. the authors of the AIMS report on population in Atlantic Canada). Pointing to an aging population, and assuming continued low fertility and high migration rates, national and regional forecasting agencies were calling for continuous population decline over the next 20+ years. Such *doom-and-gloom* demographic projections appeared to be inconsistent with the excellent prospects afforded the province by an expanding oil and gas industry, Voisey's Bay nickel and Lower Churchill hydro potential. Agents such as these were essentially projecting a significant downward spiral for the province's population over the next few decades. A meeting and consultation between the parties was sought to exchange information and views, the objective being to seek somewhat of a consensus view or, at minimum, a shared understanding of the way provincial demographics had unfolded in the past and were likely to unfold in the future.

The panel was convened in St John's, Newfoundland on January 13 and 14, 2001. Its make-up, which was jointly agreed upon between ACOA and Provincial Finance, was as follows:

Attendance at the Panel of Experts Session

Academic Panel[1]	*Provincial Finance (E&SB)*	*Federal ACOA*
Dr. Doug May (MUN), Chair	Bev Carter (Presenter)	Don Hogan (Presenter)
Dr. Dane Rowlands (Carleton U)	Alton Hollett	Paul Parsons
Dr. Roy West (MUN Medical)	Rod Forsey	*Conference Board of Canada*
Dr. Stan Winer (Ottawa U)	Ken Hicks (Presenter)	Mario Lesebvre (Regional Unit)
Dr. Byron Spencer (McMaster U)	Linda Bartholomew (Presenter)	*Statistics Canada*
	Patti Powers	Francois Nault (Demography Unit)

[1] Biographies for the panel are provided in Appendix 4.

The consultation with the panel was based on a series of presentations designed to provide an overview of key provincial and sub-provincial demographic trends by way of background — fertility rates and births; mortality rates and deaths; in-, out- and net-migration; population aging; migration; and finally the economic and demographic scenarios developed as part of the project (see Appendix 5 for charts detailing the presentations). As well, Dr. Byron Spencer provided an overview of the POPPS model which had been used to develop the detailed population projections (see Appendix

6). The panel was then asked to review and comment on the economic and demographic scenarios, assumptions, and methodology (see Appendix 7).

Generally speaking, none of the Panel members took issue with the major economic assumptions that had been made or the assumptions concerning fertility and mortality rates, which were very much in the same ball park as the others. There were questions about the migration assumptions, specifically about whether or not the assumption that net in-migration would occur in response to future labour market requirements was reasonable given historical trends. Some members felt it would be important to consider the implications of this not occurring (i.e., the in-migration needed under the economic scenarios presented), and thought it would be important to study how labour markets respond to shortages. Wage rate patterns of the past will not likely continue in the future. The province has remained competitive due to the low wage rates although inefficient in the presence of social and economic development policies aimed at maintaining status quo. If the province is to compete in the future, there will need to be convergence in productivity and wage rates as the labour market tightens up. It was also questioned whether or not the NALEM model was the best tool for analyzing long term (i.e., 25 years or more) demographic trends in the Province, and in that regard some panel members thought it would be best to focus on the medium term — 10-15 years.[1]

During the discussion the Province maintained its confidence in the NALEM model as an analytical tool to be used in conjunction with the POPPS model, noting that it had been reviewed by Federal Finance a few years ago in connection with some joint work and met with that federal Department's approval. The province also maintained the view (i.e., assumption), agreed upon between ACOA/NF Finance when details of the projections were being worked out, that net in-migration would occur if jobs were available and wages were competitive with other parts of Canada. A key determinant of past out-migration was a shortage of jobs in relation to the number (or potential number) of new labour market entrants. This will not be an issue in the future due to attrition as current, aging workers begin to retire in large numbers. Any net employment growth would only add to the attrition-related demand for workers.

The underlying assumptions and projections are reasonable *"what would happen if scenario"*, as called for by the proposal, and this is confirmed by the regional consultations and the related population projections. The economic/demographic projections are based on participation rates approaching, though not reaching because of seasonality of employment, national levels. They also include assumptions of fairly low unemployment rates and assume fairly strong productivity growth that would see productivity levels in this province at, or above in some cases, national levels.

Both Statistics Canada and the Conference Board of Canada felt the province's analysis and projections were reasonable. Moreover, it is noted that while the formal consultation took place in

---

[1] It is noted that the purpose of the project was to develop *"what would happen if"* scenarios (and not *"view of the world"* scenarios) under an ACOA/NF Finance agreed upon set of assumptions. Labour demands not being met was not one of the agreed upon assumptions, though it might be worth considering in future work with a different purpose in mind.

January 2001, informal discussions with the agencies represented began a year or more prior to that. The projections, and hence demographic views, of both Statistics Canada and the Conference Board of Canada much more closely approximate the province's now than they did a year ago, as illustrated in Appendix 11.

More detailed notes on the panel of experts consultation are provided in Appendix 7.

REGIONAL CONSULTATIONS

A series of regional consultations were held over a one year period beginning in April 2000. The consultations were held in conjunction and cooperation with the Strategic Social Plan Boards throughout the province, and covered all economic and social regions/zones (i.e., Economic Zones, Health and Education regions). Virtually all of the social sectors were represented and many of the economic sectors. In addition, all three levels of government (federal, provincial and municipal) were represented at most of the consultations. Youth were also represented.

The consultations were facilitated by Dr. Doug May, the project coordinator, and based on a series of presentations designed to provide an overview of key provincial and sub-provincial demographic trends by way of background, followed by a presentation which focused on demographics in the consultation region. The presentations were similar to those for the Panel of Experts but more condensed. Copies of the charts which guided the presentations are provided in Appendix 3.

Summary of Major Themes

There were several major themes which participants discussed at the regional consultations. The lack of job opportunities and the state of the economy in many rural areas was considered by participants to be a significant factor in the loss of youth in rural areas. For youth participants, social issues were important. Youth indicated they are more recently choosing to leave because of losses of their peer group, thus, the loss of social interaction in their communities. They are choosing post-secondary education more often than in the past and there were differences in the choices of males and females to participate in post-secondary education and also in the age in which they chose to migrate. Seniors were also beginning to move closer to services in small and medium sized service centers. Generally, the perception was that migration of both youth and older seniors is continuing in small rural communities and concerns were expressed about the impacts of the changing age structure of the population and the long-term survival of rural communities.

A decline in the size of the youth cohort has been projected for some time because of declining births, however, the decline was exacerbated in the 1990s by several shocks that had significant implications for rural parts of the province — the fishery collapse, EI reform, and government restraint. The fishery and government sectors had been important generators of new employment during the mid-1970s through mid-1980s period, so these shocks hit particularly hard, and increased net out-migration levels, mainly of young people, resulted .

EI reform and the perception that it will be increasingly difficult to obtain enough "stamps" to qualify for benefits, has created uncertainty for the province's highly seasonal rural economy. The fishery in the province has fundamentally changed since the early 1990s. Workers now have higher incomes on average but fewer people work in the fishery. Thus EI benefits from seasonal work in the fisheries is accessible by fewer people.

The perception is that Governments, both federal and provincial, reduced their presence in the economy during most of the 1990's as fiscal restraint took priority over social spending. There is also a perception that there has been a tendency to consolidate services into larger centers, which in turn may be attracting people away from smaller, isolated communities.

In rural areas, the perception is that tourism has become a priority for economic development. Tourism often has lower wages than in the fishery, and there is a view that resource constraints are chipping away at traditional rural lifestyles. Draws to larger centres for retail and personal services are resulting in movement towards larger centres along the Trans Canada Highway. The view was that good transportation infrastructure should ensure survival of communities in close proximity to urban areas.

In urban areas the economic trends are different than rural. There is growth in St. John's as a result of offshore oil development. The new knowledge-based economy is growing and it requires a significant pool of educated labour. This is creating an urban bias. Connectivity is strongest in urban centres and cultural amenities continue to improve in urban areas. These factors are further decreasing populations in smaller communities as youth leave for work and the amenities of an urban lifestyle.

Loss of jobs in the fish processing and re-entry of older workers in the restructured fishery left youth without opportunities for work in their communities. Many have chosen to migrate to urban centres but more particularly out of the province to find employment.

Some of the themes that emerged during the consultations were particular to youth:

- Attachment to place is not as strong as it has been traditionally, with parents encouraging out-migration from smaller communities and youth seeing greater opportunity for social engagement in larger centers.
- Fewer youth has meant smaller enrollment in rural schools, which has translated into less variety in course selection, and less guidance counseling. IT solutions are being pursued. However distance education or e-learning necessitates increased bandwidth to rural and remote communities.
- There is some concern about the lack of career counseling available to rural youth. Many are unsure about what they should be pursuing after high school.
- For many rural youth, who have to leave home to pursue post-secondary education, the costs of post-secondary education are relatively high, putting pressure on graduates to move quickly to obtain higher wage employment than can be offered in their home communities.

The view that people will migrate into Newfoundland as jobs from retiring boomers become available was not echoed during the consultations in rural parts of the province. The feeling was that in-migrants would gravitate towards larger population centres, particularly the northeast Avalon, rather than small communities in less urban regions of the province. The general view was that it would be difficult to attract labour back to or into smaller communities, so that businesses may have to adopt more labour saving technologies in order to maintain their operations.

The seniors' issue stood out as being of significant concern in virtually all regions. Availability of home care workers and health care professionals has already emerged as a critical issue for some of the more isolated areas of the Province. There was concern that without an economic anchor like the fishery, there will be a major shortage of people available to work in the low wage home care industry. Speculation was that many seniors may have little choice but to move in order to obtain home-care and other health services. There was also a suggestion that there will be an increase in the demand for "assisted living" accommodations as opposed to moving from private housing to seniors homes. With the impending exit of early boomers into retirement, this issue will become an increasingly important one over the next decade. Some echoed the view that considerable attention should be paid to the area of retirement planning.

Developing the Regional Population Projections

Following the presentations and question/answer periods, participants were divided into small groups covering each of the Economic Zones and each of the social sectors. Each group was provided with certain statistical demographic information about the zone, particularly pertaining to migration. Participants were then asked to formulate assumptions about the likely future path of migration, based on their knowledge of the region. These assumptions were then fed into the Department of Finance regional demographic projection model, and the results were given back to participants within an hour for discussion and input. The results of the consultations were a key input to the development of regional population projections.

Overall the provincial population was projected, on the basis of the regional consultations, to decline by 3.0% between 2000-2016; this decline falls about mid-way between the high and medium scenarios. It is noteworthy that the 3.0% decline estimated by the regions was based on their own estimate of the population in 2000 (they were asked to formulate estimates from 1996-2000-2016), and that this estimate was some 8,000 lower than the Statistics Canada estimate which existed at the time, perhaps a foreshadowing of what the 2001 Census may reveal.[2]

---

[2] Statistics Canada typically overestimates the provinces population between Census years because of missed migration, and then makes historical revisions once new Census information is available. The next Census is due in 2001.

ECONOMICS & STATISTICS

DEMOGRAPHIC OUTLOOK BY ECONOMIC ZONE

Change in population by Economic Zone for the 2000-2016 period, and for all three scenarios (low, medium and high) is summarized in the two charts on the following page. These projections reflect the input obtained during the regional consultations. As the charts show, variation in demographic trends among regions of the province is projected to continue in the future, with consequent implications for future regional differences in births and aging patterns (see map of the Economic Zones on previous page).

Zones Projecting Population Decline

Over half of the Economic Zones (13 out of 20) do not think their populations will level off beyond 2000. Losses are projected to continue throughout the next 10 or 15 years, at rates ranging between -3.7% and -21.7%. In absolute terms, projected declines in the size of the total population are relatively small in most Zones under the medium scenario (i.e., well below 5,000) but do range between 5,000 and 8,500 in several of the Zones. Restructuring of the fishery and reform of the EI program have had significant impacts on many of these Zones, and were most often cited as key reasons for the population outlook. Changing expectations of youth, who are pursuing higher education in greater numbers, was also important in the outlook.

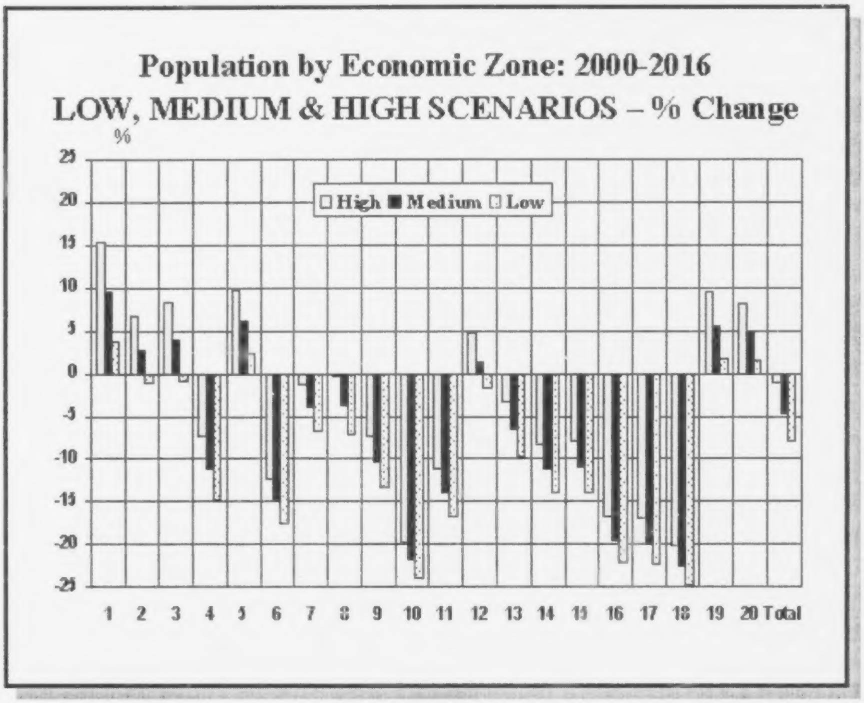
Zones Projecting Population Growth

While only two zones, both in Labrador, experienced population growth from 1991-2000, seven of the twenty Economic Zones expect population growth from 2000-2016, ranging between 1.4% and 9.5% under the medium scenario over the period. In absolute terms, the growth in population is projected to be less than 1,000 in these Zones with the exception of Zone 19 which takes in the St. John's Census Metropolitan Area, where growth in the 10,000 range is projected.

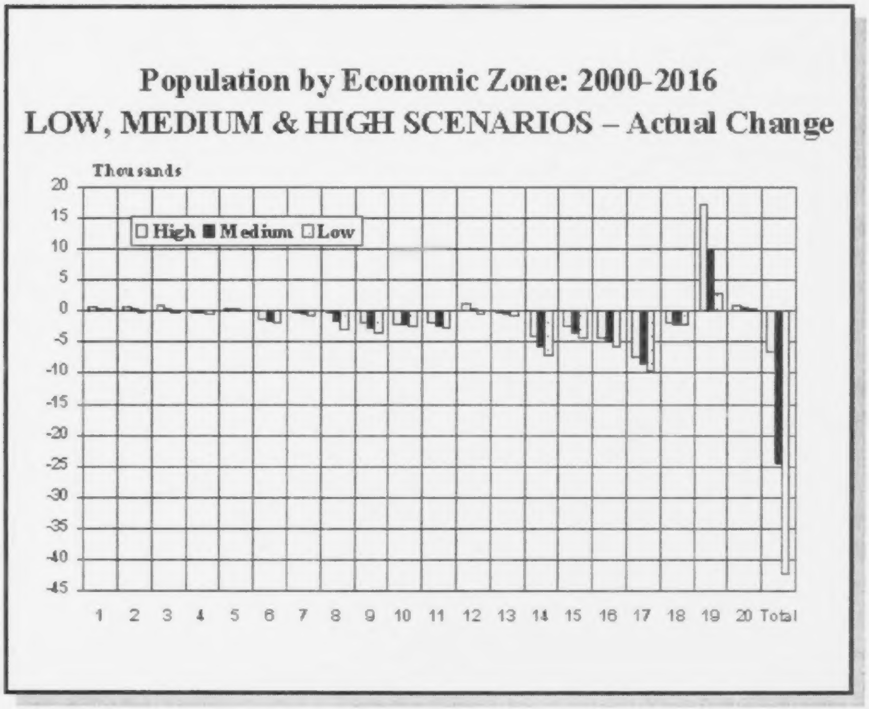
Four of the population growth zones are in Labrador and reflect, among other things, optimism surrounding the completion of the Trans-Labrador Highway, continued growth in tourism related activity, potential for hydroelectric and mineral developments in the area and continuing growth in Aboriginal populations. It also reflects a belief that in the future, retirees will remain in the area to a much greater extent than has occurred in the past. The Grand Falls-Windsor zone, where the information technology sector is growing, and both zones on the eastern Avalon, where strong performance is expected in a number of sectors including the IT/Customer Contact and oil and gas sectors, are also expected to record population growth. Growth in these zones is also partly related to internal migration from other parts of the province, consistent with the expectation of continued urbanization in Newfoundland and Labrador. For instance, the St. John's region which comprises zone 19 accounted for 31.8% of the total provincial population, but under the Medium scenario this share will rise to 37.3% by 2016.

Overall Population Decline Projected

Overall, total population for the province as a whole is projected to continue declining, by some 4.6% between 2000-2016 under the medium scenario. Details of all three demographic scenarios, for both total province and the Economic Zones, are provided in Appendices 8-10 for the low, medium and high scenarios respectively.



Population by Economic Zone: 2000-2016
LOW, MEDIUM & HIGH SCENARIOS – % Change



Population by Economic Zone: 2000-2016
LOW, MEDIUM & HIGH SCENARIOS – Actual Change

Population and Labour Force Aging

The province's median age has risen continuously since the early 1970s, from 21.2 years in 1972 to 37.2 years in 2000. Under the medium scenario, the median age is projected to continue climbing and to reach 46.2 years in 2016.[3] In other words, over half the province's population is projected to be older than 46 in 2016. These past and projected future changes are the result of significant shifts in the age structure of the province's population brought on by declining births and rising deaths pointing to negative natural population change in the near future, and net out-migration of young people which is not projected to become net in-migration until the end of this decade.

The province as a whole is expected to continue undergoing significant change in its age structure in the coming years. The child/youth population (i.e., 0-19 years of age) declined from 31.6% of the total population in 1991 to 25.0% in 2000. By 2016, under the medium scenario, the child/youth population is projected decline to 17.5% of the total population. For some Economic Zones, the decline will be even more pronounced than this (see chart on next page). For instance, in Economic Zone 10 (Channel-Port aux Basques), the child/youth population declined from 31.6% in 1991 to 22.7% in 2000, and is projected to decline to only 12.0% in 2016 under the medium scenario. Declines in the proportion of population in this age group are projected in all Economic Zones, however, the proportion projected in 2016 varies considerably across Zones — from 31.8% in Zone 1 (Northern Labrador) to about 12% in Zones 7 and 10.

At the same time that the relative size of the child/youth population has been declining, the population over 65 years of age has increased — from 9.6% of the total population in 1991 to 11.6% in 2000, and it is projected to rise to nearly 19% in 2016 under the medium scenario. As with the child/youth population, significant regional differences in aging patterns are expected. Zone 10 once again stands out, with the share of population 65+ rising from 9.0% in 1991 to 12.6% in 2000, and projected to rise to 26.8% in 2016 under the medium scenario (see chart on next page).

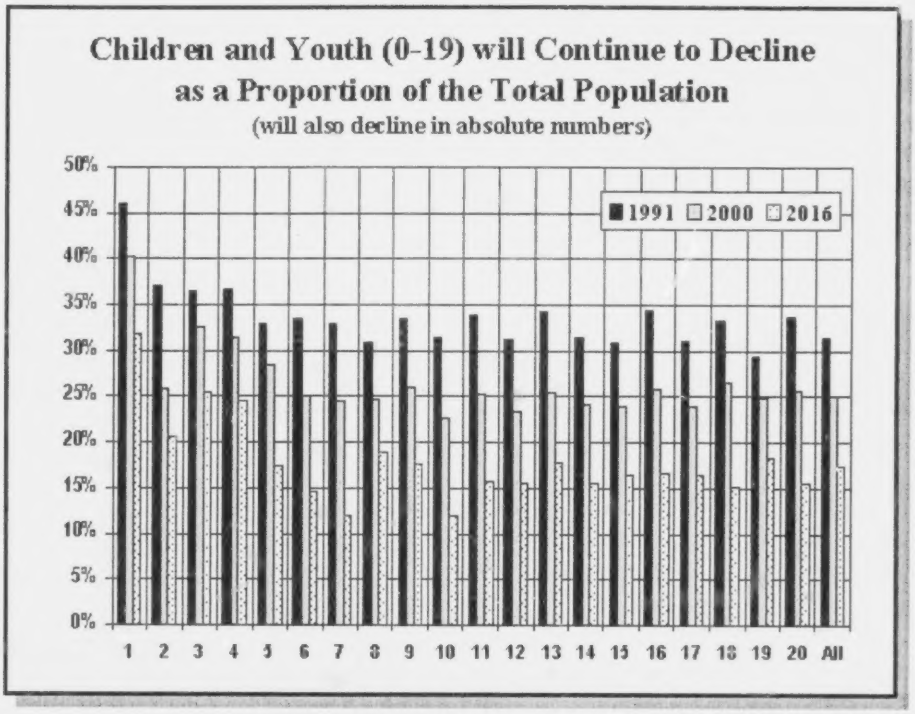
The prime labour force age population (i.e., those 20-64) is also projected to age over this period. Under the medium scenario, the total size of the 20-64 population is projected to decline marginally from 2000-2016 by just under 5%, however, the age structure of this group will undergo significant change. In 2000, those 20-44 comprised 60% of this age cohort whereas by 2016 it is projected to comprise only about 48%. The proportion 45-64, on the other hand, is projected to rise from 40% in 2000 to about 52% in 2016. These changes are illustrated on the last page of Appendix 9 for the medium scenario.

Interestingly, regional dependency ratios[4] are expected to be virtually unaffected by this aging of the population other than the fact that a larger proportion of the "dependent" population will be 65+, and likely to have retirement income with which to support themselves.

---

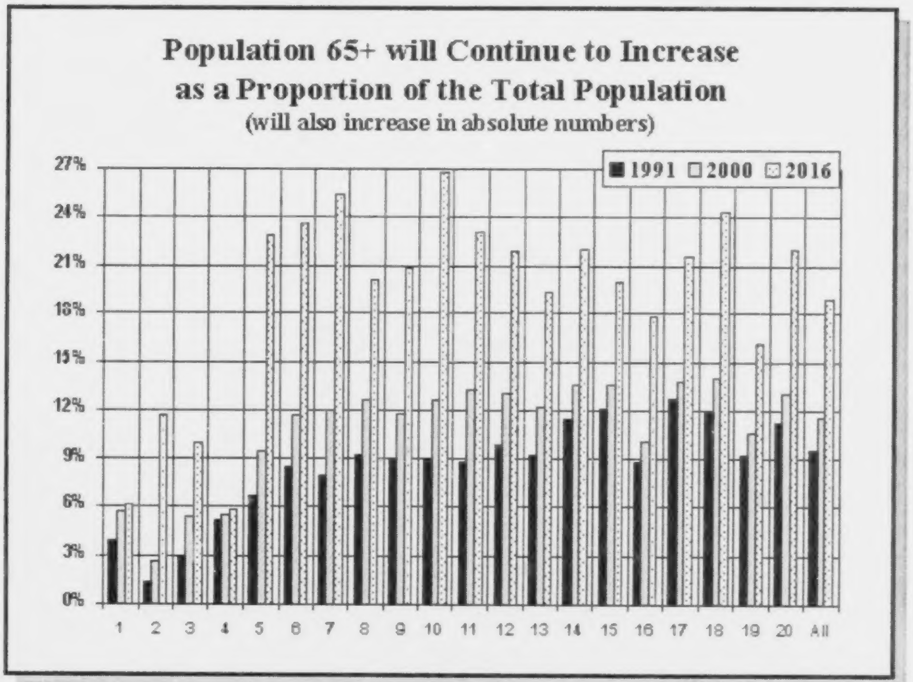
[3] The median age can be thought of as the midpoint of the population age profile. It refers to the age at which 50% of the population would be younger and 50% would be older.

[4] The dependency ratio refers to the population 0-19 and 65+ as a proportion of the prime working age population 20-64 that is available to support the younger and older population.



Children and Youth (0-19) will Continue to Decline as a Proportion of the Total Population

(will also decline in absolute numbers)



Population 65+ will Continue to Increase as a Proportion of the Total Population

(will also increase in absolute numbers)

SUMMARY AND CONCLUSIONS

The province's population is projected to decline between 2000 and 2016 under all three scenarios, though at a more modest pace under the medium or base case scenario than has occurred over the past decade. This reflects the expectation that births will continue falling while the number of deaths will continue to rise with population aging. In the future, population decline will be more related to natural population changes as deaths exceed births for the first time in the provinces history. Nevertheless, net out-migration (as a long term trend) is projected to continue until at least the turn of this decade, when labour shortages are projected to lead to back and/or in-migration. Projected declines for the province's total population range between -1.2% under the high scenario to -7.9% under the low scenario.

These demographic trends are expected to differ considerably across Economic Zones. It is expected that, in the midst of overall population decline, there will be pockets of population growth as rural parts of the province (especially fishery-dependent areas) are projected to continue losing population while urbanization continues and region-specific economic growth and diversification leads to net in-migration to some areas of the province.

All regions of the province are expected to continue aging, but as with total population change, the aging trend is expected to be more pronounced in some regions of the province than in others. The youth population is expected to decline in all parts of the province, however, projections call for more rapid decline of the rural youth population. For instance, the 5-19 year age cohort is projected under the medium scenario to decline by about 35% for the province as a whole whereas on the northeast Avalon the projected decline is about 25%. In Zones 6 and 7, on the other hand, projected declines are in the 50% range.

The implications of regional population shifts and differing trends across regions are likely to be significant. Assessing these implications was not, however, the purpose of this joint project but rather is the subject of the province's own internal *Demographic Study* since virtually all of the implications have to do with areas of provincial jurisdiction. The purpose of this joint project was, as stated in the terms of reference, *to develop well-informed projections of Newfoundland and Labrador's population, for provincial and sub-provincial levels.* This joint project has achieved that objective and has succeeded in building a consensus between the two levels of government on a base case set of population projections for the province. This process also engaged regional interests in a discussion of demographic trends which was key to the development of the set of sub-provincial projections along zone boundary lines. Moreover, the fact that we have been able to discuss this openly has assisted both the provincial and federal government's in their respective areas of interest. The consultations and discussions between the study group and the provinces's Strategic Social Plan Boards afforded both groups the opportunity to exchange a wealth of information and knowledge about the recent trends and future prospects within each region of the Province. In and of itself, this has been a good thing. School Boards, Health Boards, community and economic development groups, ACOA and the Department of Finance have, and continue to benefit from this exchange.

Appendix 1

Proposal to Develop Long Term Demographic Projections for Newfoundland and Labrador

An Appendix to
LONG TERM POPULATION PROJECTIONS FOR
NEWFOUNDLAND AND LABRADOR:
A Consultative Approach
DRAFT #2 — Final Report

A Joint Project Between
Economics and Statistics Branch, Department of Finance
and
Planning and Coordination Division, Atlantic Canada Opportunities Agency
(November 2001)

PROPOSAL TO DEVELOP
LONG-TERM POPULATION PROJECTIONS FOR NEWFOUNDLAND AND LABRADOR

a) Proposal Name: Newfoundland and Labrador Demographic Projections

b) Date of Submission: October 6, 1999

c) Implementing Party: Canada/Newfoundland

d) Sponsoring Department: Atlantic Canada Opportunities Agency, Policy and Coordination Division *and* Provincial Department of Finance, Economics and Statistics Branch

e) Responsible Officers:

Ms. Beverley Carter
Assistant Deputy Minister
(Economics and Statistics)
Department of Finance
Government of Newfoundland and Labrador
St. John's, Newfoundland

Don Hogan
Senior Economic Analyst
Policy and Coordination Division
Atlantic Canada Opportunities Agency
Government of Canada
St. John's, Newfoundland

f) Objectives of Project: The key objective of the project is to develop well-informed projections of Newfoundland and Labrador's population, for provincial and sub-provincial levels.

g) Background: The province's economy experienced numerous shocks during the 1990s including a worldwide recession; groundfishery collapse and subsequent termination of income support programs; major reform of the E.I. program; and government restraint/downsizing. Such factors caused significant employment/income losses and induced both socioeconomic and demographic adjustments. Out-migration was a major adjustment mechanism. High levels of net out-migration, combined with an aging population and declining births, resulted in a 39,300 or 6.8% population decline from 1993-94 to1998-99.

Pointing to an aging population, and assuming continued low fertility and high migration rates, national and regional forecasting agencies are calling for continuous population decline over the next 20+ years.[1]Such *doom-and-gloom* demographic projections appear to be inconsistent with the excellent prospects afforded the province by an expanding oil and gas industry, Voisey's Bay nickel and Lower Churchill hydro potential. In addition to the uncertainty about the likely path of the province's total population, there are also uncertainties related to the future spatial dimensions of population.

Reasonable long-term estimates of the province's total population and its geographic distribution (i.e., *how many people, and where will they be living?*) are critically important to long-term strategic planning and development in the areas of public service provision, and community economic development.

h) Proposal Design: This project is broken down into three parts as follows:

---

[1] The Conference Board of Canada's fall-'99 forecast calls for a steady decline in Newfoundland's population - from an estimated 555,000 in 1998 to 454,000 in 2020. Similarly, Statistics Canada 1999 projection puts Newfoundland's 2013 population at 495,000. The Atlantic Institute of Market Studies puts Newfoundland's population at 462,000 by 2036.

PART 1: Provincial Level Economic Scenarios

Product — Set of Three Long Term Economic Projections: Economic and demographic scenarios are closely interrelated. Economic activity influences demographic developments mainly (and directly) through the migration component of population change, but could also influence natural population change. The economic scenarios would:

- not be a *view of the world* forecast (i.e., here's how we think the future will unfold) but rather *what would happen if* projections i.e., here is how the future would unfold given the underlying set of assumptions;
- vary mainly, though not entirely, along major project lines (e.g., oil & gas, mining, etc.)
- be built up around a set of assumptions that would be generally agreed upon between ACOA and provincial Finance.

Process — Contract with Dr. Doug May of Memorial University of Newfoundland: As per the attached CV, Dr. Doug May is the ideal candidate for coordinating this project. Dr. May is:

- familiar with the NALEM model — acted as Technical Advisor to the Steering Committee responsible for its development (jointly funded project with ACOA in 1990/91), working cooperatively with Dr. Ross Preston of the Economic Council of Canada in his capacity as Technical Advisor to the project;
- is well respected locally;
- has an excellent understanding of the Newfoundland economy;
- has significant expertise in the demographic area, and has worked with other nationally and internationally known experts in the field.
- is on Standing Offer with ACOA for economic/policy research work.

Deliverables to Include:

a) Set of three economic scenarios (Low, Medium and High), providing an acceptable range of possible/potential future economic outcomes;
b) Concise report outlining methodology, assumptions and key results.

PART II: Provincial Long Term Demographic Projections

Product — Set of Three Long-Term Demographic Projections for the Province: The demographic projections would be linked to, and consistent with, the economic scenarios in Part I. This approach would:

- ensure that labour market requirements, as reflected in future employment levels, are taken into account in the development of demographic projections;
- result in a set of projections that vary along the same lines as the economic scenarios
- be built up around a set of inputs generally agreed upon between ACOA and provincial Finance.

Process — Contract with Dr. Doug May of Memorial University of Newfoundland and Panel of Expert Review/Input: Process would be similar to what is outlined for Part 1. Also see discussion in Part IV of this proposal for details concerning Panel of Experts.

Deliverables to Include:

a) Set of three demographic scenarios (Low, Medium and High);
b) Concise report outlining methodology, assumptions and key results.

PART III: Regional Level Demographic Projections

Product — Set of Three Long Term Demographic Projections by Economic Zone: In addition to reasonable projections of the future size and age structure of the total population of Newfoundland and Labrador, projections of regional (e.g., Economic Zones) populations are also needed. Population projections by Economic Zone would be constrained to those for the total province, as discussed in Part II. They would thus be consistent with the economic scenarios in Part I and subjected to review by a *Panel of Experts*, as discussed in Part IV below.

Process — Intelligence Gathering and Regional Consultations to Support Development of the Regional Demographic Projections: The demographic element of many regions of the Province, especially those most affected by changes in the fishery/make-work/UI systems, continues to be very dynamic. The 1996 Census information is now three years out of date, and the 2001 Census information will not be available for at least another three years. More current qualitative and quantitative information is needed to aid in developing regional demographic projections. This would be acquired through:

Phase 1: Economic/Demographic Intelligence Gathering

a) Developing tailored/targeted *Pre-Visit Regional Profiles*
b) Information/intelligence gathering through a series of regional consultations (2 or more as appropriate) including regions of the *Strategic Social Plan*. These consultation will provide the mechanism by which the assumptions underlying regional population projections can be examined by people in the respective region, and by which feedback can be obtained and used to *fine tune* the projections.

Phase 2: Development of Demographic Projections:

The ususal approach to regional projections is allocation based on historical shares, with an "adding up" constraint. Given regional dynamics, a more useful approach would be to develop regional population projections:

- constrained to the high, medium and low totals from the provincial projections in Part II (i.e., retain the *adding up* constraint); but
- reflective of, and/or incorporating, regional information and intelligence gathered in Phase I.

Deliverables to Include:

c) Set of three demographic scenarios (Low, Medium and High), providing an acceptable range of possible/potential future economic outcomes;
d) Concise report outlining the methodology; assumptions and key results.

PART VI: Panel of Expert Review of Economic and Demographic Projections

The *Panel of Experts* will be comprised of well-know experts in the field of demographics, and will be coordinated by Dr. Doug May. Its make-up will be jointly agreed upon between ACOA and Provincial Finance, but determined in consultation with and on the recommendation of Dr. May.

The *Panel* will be asked to review economic and demographic scenarios, including their underlying assumptions, as well as the methodology employed to develop the three population scenarios (both provincial and regional).

A meeting of this *Panel* will take place in Newfoundland during the early summer of 2000. Participants/attendees (other than the *Panel* itself) would be restricted to government officials. A number of individuals from the Economic Zones/SSP Regions who participated in the consultations would also be invited as observers. Federal/Provincial Departments represented would be at the discretion of the *Sponsoring Departments* (i.e., ACOA and Provincial Finance).

i) Management Structure: Dr. Doug May will be responsible for coordination of the three parts of the project, reporting to a committee made up of: Ms. Beverley Carter (Provincial Dept. of Finance), Mr. Don Hogan (ACOA), Mr. Keith MacDonald (ACOA), Mr. Paul Parsons (ACOA), Mr. John Collins (DFO, Newfoundland), Fred Phelan of HRDC; Taylor Hall (DDRR) plus others that may be recommended by the ERA Planning & Market Research Program Committee.

j) Anticipated Benefits The project results will be utilized by a wide range of provincial government departments in their long term planning, especially in the provision of educational, health and community infrastructure services. For ACOA and DDRR, the output will be factored into how we approach long term regional economic development at the sub-provincial level. The projections sh/could be utilized by the Regional Economic Development Boards as part of their on-going strategic economic planning process. HRDC/HRE will benefit by obtaining a better basis for projecting labour supply at the sub-provincial basis.

More generally, the results may be used by the provincial and federal governments as a basis for refining and/or developing economic development approaches for rural Newfoundland. Further, the *Panel of Experts* approach provides for an objective, arm's length analysis of the Newfoundland situation. By so buying into this approach, both senior levels of government avoid the possibility of sending contradictory signals regarding long range prospects for Newfoundland's population.

k) Communications Strategy The research approach is designed to engage key stakeholder departments at the federal and provincial levels through the *Panel of Experts* component. Regional Economic Development Boards will be engaged following completion of preliminary Economic Zone projections (per Part III). The *Coordinator* will be responsible for the preparation of a Summary Report suitable for public consumption (through print media). It is understood, however, that this project is intended to serve the internal needs of the Provincial and Federal governments. It is further understood that there will be NO PUBLIC RELEASE, IN ANY MANNER WHATSOEVER, **OF ANY PARTS** of this project's results without the **EXPRESS WRITTEN PERMISSION/AGREEMENT** of the senior officials (i.e., Deputy Minister or equivalent) of both implementing parties (ACOA and Newfoundland Finance). This restriction includes the economic/demographic scenarios, regional consultations and Panel of Experts[2]

l) Present Planning Capability This research will enhance the capability of both organizations. The Economics and Statistics Branch of the Provincial Department of Finance has considerable expertise in economic and demographic analysis at the macro level. In the area of demographics, ACOA (Economics Unit) has carried out research into historic and current trends in population change at the provincial level. However, the degree of expertise and knowledge is limited in terms of sub-provincial population dynamics.

Without the support of the ERA Planning Program, neither organization will be in a position to undertake this research. Projections available from national agencies do not provide sub-provincial breakdowns and, by and large, have not been rigorous enough to provide a strong level of confidenc in results.

---

[2] Given the nature of this research, and depending on the results, both orders of government may wish to maintain a low-key communications strategy.

m) Estimated Cost: Costs are estimated at $74,200 broken down as follows:

Estimated Cost – Part I: $9,000	
PROFESSIONAL SERVICES: 15 days @ $600/day	$ 9,000
Estimated Cost – Part II: $9,000	
PROJECT FACILITATION: Dr. May – 15 days @$600/day	$ 9,000
Estimated Cost – Part III: $19,000	
ZONE PROFILES: Research Assistant – 20 days @ $200/day	$ 4,000
ZONE CONSULTATIONS: Research Assistant –40 days @ $200/day	$ 8,000
Travel Cost —Research Assistant (hotel, meals, etc.)	$ 5,000
Facility Costs	$ 2,000
Estimated Cost – Part IV: $37,200	
TRAVEL: 12 participants (6 from Ontario)	$ 12,000
PARTICIPANT FEES: including preparation	
4 days each @ $600/day	$ 12,000
Meals and Incidentals: 2 days each @ $50/day	$ 1,200

TOTAL COST:	
Part I: Economic Scenarios	$ 9,000
Part II: Provincial Level Projections	$ 9,000
Part III: Zonal Population Projections	$ 19,000
Part IV: Panel of Experts	$ 37,200
GRAND TOTAL	$ 74,200

Cash Flow:

It is estimated that $25,000 will be flowed during 1999/2000 and the balance of $49,200 will flow during 2000/01.

m) Inter/Intra Government Relationships: ACOA and the Department of Finance share the belief the Agencies should work together to undertake a more rigorous analysis of population trends, thereby providing a common basis for projecting long range population change

n) Project Implementation: Dr. May will lead the actual project with technical support and advise from Paul Parsons (ACOA) and Ken Hicks (Provincial Finance). Don Hogan and Bev Carter will advise on overall direction of the project. Meetings with other members of the Steering Committee shall take place on an as required basis - determined by Dr. May, Bev Carter and Don Hogan.

IN WITNESS WHEREOF the parties have signed this Agreement.

SCHEDULE OF MAJOR PROJECT MILESTONES AND THEIR APPROXIMATE DATE OF COMPLETION

Approval of proposal	January 31, 2000
Develop plan for consultations	February 20, 2000
Organize consultations	February 28, 2000
Economic Scenarios	March 15, 2000
Demographic Scenarios (total province)	March 30, 2000
Develop plan for panel of experts	April 15, 2000
Complete Consultations	April 31,2000
Panel of experts meeting	June, 2000
Demographic Scenarios (regional)	In Time for Consultations

Project Completion Targets:

Analysis/Reports (substantially completed)	July 31, 2000
Finalize all aspects of project	September 30, 2000

Appendix 2

Economic and Demographic Projections
Methodology and Assumptions

Detailed Notes

An Appendix to
LONG TERM POPULATION PROJECTIONS FOR
NEWFOUNDLAND AND LABRADOR:
A Consultative Approach
DRAFT #2 — Final Report

A Joint Project Between
Economics and Statistics Branch, Department of Finance
and
Planning and Coordination Division, Atlantic Canada Opportunities Agency
(November 2001)

Long Term Economic Scenarios

The proposal governing this joint work recognized that economic and demographic scenarios are closely interrelated, and called for an integrated framework to ensure consistency between economic projections and corresponding population projections. Economic activity influences demographic developments mainly (and directly) through the migration component of population change, but could also influence natural population change. Therefore the economic projections were necessary to take into account future labour supply and demand issues and how this could reasonably be expected to translate into future migration trends.

The proposal called for a set of three economic scenarios (Low, Medium and High) providing an acceptable range of possible/potential future economic outcomes, and a set of three demographic scenarios linked to and consistent with the economic scenarios. This integrated approach was adopted to ensure that demographic projections took into account future labour market supply and demand requirements, as reflected in future employment levels. It also ensure that the demographic projections varied along the same lines as the economic scenarios, and were built up around the inputs agreed upon between ACOA and provincial Finance.

The economic and demographic projections are not, nor were they intended to be, a *view of the world* forecast (i.e., here's how we think the future will unfold) but rather are *what would happen if* projections (i.e., here is how the future would unfold given the underlying set of assumptions).

The three economic/demographic scenarios were built up around a set of assumptions that were generally agreed upon between ACOA and provincial Finance. The economic scenarios, which included projections for total population, were developed using the Newfoundland and Labrador Econometric Model (NALEM) described elsewhere in this report. The demographic scenarios were developed using the Population Projection System model (POPPS), also described elsewhere in this report. An iterative process between NALEM and POPPS ensured consistency between the two results. The work was coordinated by Dr. May, the project coordinator, and the results were presented at all consultations that took place as part of this project.

The key issues for Newfoundland and Labrador's long-term economic outlook revolve around assumptions for mega projects such as future oil developments, Voisey's Bay and Labrador Power and assumptions for future labour productivity (output per worker) growth. Other important factors included the outlook for current resource industries, assumptions for real wage growth, population levels and issues surrounding future labour supply including age and gender specific labour participation rates and the unemployment rate. All of these factors were varied across all three economic scenarios.

The mega projects included in each scenario are shown in the table below. For example, the Voisey's Bay project is included in all three scenarios, but in the low scenario only mining of the oviod portion of the discovery is included. No processing of the ore in Newfoundland and Labrador is assumed to occur for this scenario. In the medium and high scenarios, full mining and processing are assumed to occur in this province. In the case of offshore gas development, it in excluded from the low scenario, starts in 2015 in the medium scenario and starts in 2011 in the high scenario.

Potential Mega Projects

Projects	LOW	MEDIUM	HIGH
Voisey's Bay	L[1]	M	H
Labrador Power		M	H
Terra Nova	L	M	H
Whiterose	L	M	H
Hebron/Ben Nevis		M	H
Undis. Oil 1		M	H
Undis. Oil 2			H
Gas Project		M[2]	H[3]

1. Surface ovoid portion only.
2. Starts in 2015.
3. Starts in 2011.

Major Industry Assumptions

Next a set of assumptions regarding current industries operating in the Province were developed. For example, it was assumed in all three scenarios that real GDP in the retail trade industry would grow in line with real consumer spending and real GDP in the newsprint industry would remain stable at current levels. Assumptions for the remaining industries are outline in the following table.

Major Industry Assumptions

Agriculture	Grows with local demand for products
Primary Forestry	Stable
Fish Harvesting	Slight increase: groundfish increases marginally, shellfish stable
Mining (excluding Voisey's Bay)	Stable
Fish Products	Slight increase with small increase in groundfish landings
Newsprint	Stable
Other Manufacturing	Grows in line with demand for products
Construction	Mega projects and core capital spending
Utilities	Stable
Trade	Grows in line with real consumer spending
Transportation Storage & Comm.	Grows in line with overall economic activity
FIRE	Grows in line with overall economic activity
Other Commercial Services	Grows in line with overall economic activity
Education	Declines, but at a slower rate than enrolment
Health & Social Services	Increases with real health care spending
Public Administration	Stable real spending

Output Per Worker Growth

Outside of the outlook for individual industries, another important determinant of future labour demand is labour productivity or output per worker trends in the future. The table below outlines historical growth rates for Canada, the United States and Newfoundland and Labrador.

Output Per Worker
All Industries
Average Annual Compound Growth

	1947 - 99	1976 - 99	last 10 Yrs	last 5 Yrs
United States	1.81%	1.37%	1.70%	2.18%
Canada	n.a.	1.01%	1.12%	1.20%
Newfoundland	n.a.	1.07%	1.50%	0.85%

As the table shows, historical growth rates have varied and the assumptions made in this area have significant implications for labour requirements projections.

Taking into account past trends and the recent advancements in computer technology, the Department of Finance in consultation with Dr. May developed the following assumptions for growth in real output per worker by industry for the province over the next 16 years. The high (meaning high labour demand and thus high population level) scenario basically has output per worker growing, on average, in line with the historical average for Newfoundland and Canada. The low (meaning low demand for labour and thus low population level) scenario assumes output per worker growth closer to the US long-term average. The medium scenario is basically in the middle of these two. For industries that show a range, growth in output per worker starts at the lower point of the range in 2001 and gradually trends to upper point of the range by 2010. The details for each industry are outlined in the table.

Average Annual Growth Rates
Real Output Per Worker
Newfoundland & Labrador
2000 to 2016

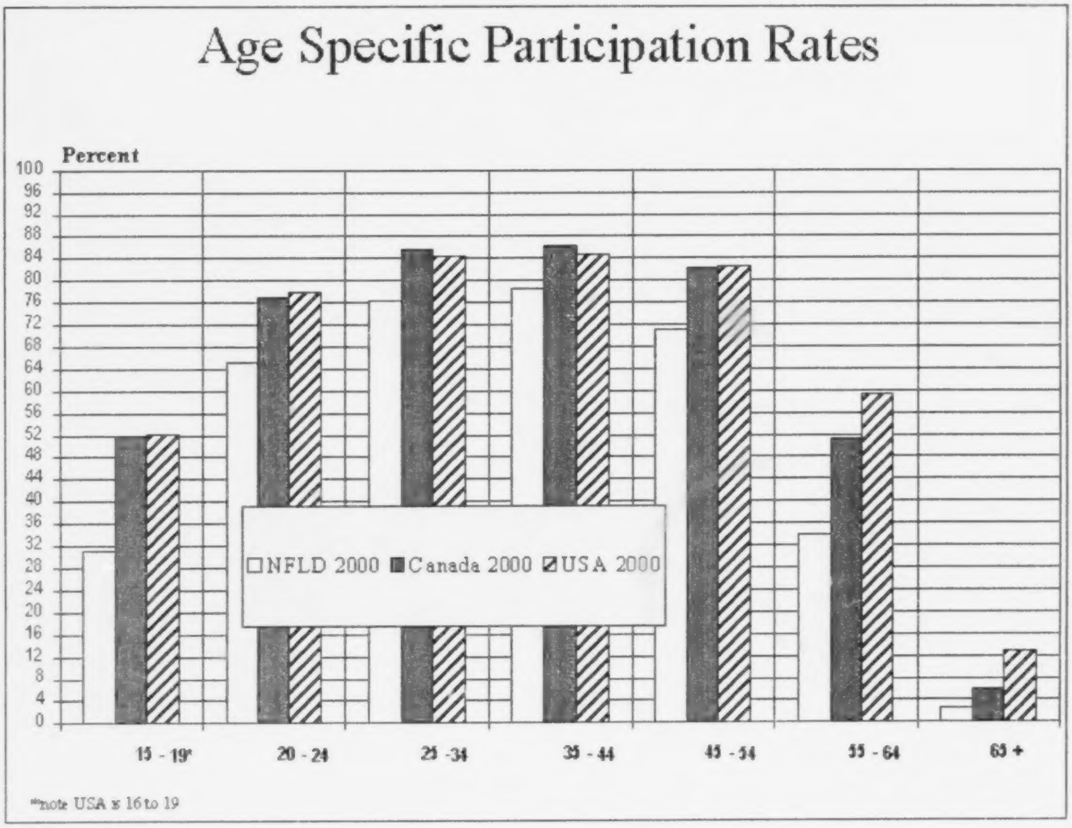
	1984 - 99	High	Medium	Low
Agriculture	0.5	1.0	1.0-1.5	1.0-2.0
Primary Forestry	-1.7	1.0	1.0-2.0	1.0-2.0
Fish Harvesting	-4.8	1.0	1.0-2.0	1.0-2.0
Mining	2.9	1.0-1.5	1.0-2.0	1.0-2.5
Fish Products	-0.7	1.0	1.0-2.0	1.0-2.0
Newsprint	0	1.0-1.5	1.0-2.0	1.0-2.5
Other Manufacturing	-0.1	1.0	1.0-1.5	1.0-2.0
Construction	-1.9	0.5-1	1-1.5	1.0-2.0
Utilities	-1.5	1.0	1-1.5	1.0-2.0
Trans Storage & Comm	2.2	1.0	1.5	1.0-2.0
Fire	2.2	1.0	1.5	1.0-2.0
Trade	1.7	1.0	1.3-1.8	1.0-2.0
Other Commercial Services	-1.1	0.5	1.0	1.0-1.5
Education	-0.8	0.0	0.0	0.0
Health & Social Services	-2.9	0.0	0.5	1.0
Public Admin.	1.6	0.5	0.5	1.0

Real Wages

Real wage rates for each industry are assumed to grow by a minimum of one percent per year. For industries where growth in output per worker is stronger than one percent per year, real wages grow in line with real output per worker.

Labour Force

Once real output, employment, and wage rate growth have been determined the economic forecast is nearly complete. The final pieces to complete the process are assumptions regarding participation rates (age specific participation rates) and the unemployment rate. Once these two factors are determined, then labour force and the population levels required to supply the labour force can be estimated. The following chart shows age specific participation rates for Newfoundland, Canada, and the United States for the year 2000. It shows that Newfoundland and Labrador's participation rates are well below that of Canada and the US across all age groups. Most of Canada's participation rates are very close to that of the US except for age groups 55 and over. Given that the US labour market was close to full employment in 2000, it was assumed that age specific rates will not get much higher than those of the US. In addition, the seasonal nature of many industries, and thus the over dependance on seasonal employment in Newfoundland and Labrador is a major reason why participation rates are lower. This is not expected to change dramatically over the forecast period.



Age Specific Participation Rates

*note USA = 16 to 19

The next table shows the assumptions made regarding the change in age specific participation rates in Newfoundland and Labrador over the forecast period. For example, in the medium case current participation rates are assumed to increase gradually such that by 2020 the gain, relative to current rates, would equal one half of the current Newfoundland - Canada gap. For the 55 to 64 age group, the Newfoundland - US gap was used.

Age & Gender

Participation Rates in 2020

Low	Increase by 25% of 2000 Can-NF Gap*
Medium	Increase by 50% of 2000 Can-NF Gap*
High	Increase by 75% of 2000 Can-NF Gap*

* NFLD - US gap for 55 to 64 age groups.

Summary

The economic projections were developed with the assumptions outlined above utilizing the Newfoundland and Labrador Econometric Model (NALEM). The model is essentially a neo-classical Keynesian synthesis where real GDP is modelled on an expenditure basis, but limited by capital stock constraints and, to some degree, by labour supply constraints. Most of the export components of final demand are determined by local resource constraints and are essentially exogenous. The service sector final demands are determined by income and/or population levels.

The various combinations of assumptions produced three economic scenarios with differing labour force and population requirements in 2016. The demographic scenarios were developed by choosing three alternative fertility rate assumptions, and three alternative life expectancy assumptions and combining them with the economic scenarios. Through an iterative process between the Department of Finance's population projection model, POPPS, and NALEM the population projections and the economic projections were adjusted back and forth, via net-migration in POPPS and via total population in NALEM, until the two were consistent with each other.

Results

The results of the projections show that labour requirements are very sensitive to assumptions regarding output per worker and participation rates. All three scenarios show a continued shifting of employment towards the service sector. Annual real GDP growth ranges from 1.9% in the high scenario to 0.9% in the low scenario. Employment growth ranges from 0.7% per year in the high case to -0.5% in the low case and the resulting population levels range from 532,000 in the high case to 496,000 in the low case. A summary of the changes in main indicators are shown in the table below.

Economic Scenarios
Main Indicators 2016

	2000*	High	Medium	Low
Real GDP ($M92)	11,852	15,952	15,230	13,618
Compound Growth	2.3%	1.87%	1.58%	0.87%
Employment (000's)	204.6	229	208	189
Compound Growth	1.0%	0.70%	0.11%	-0.48%
Unemployment Rate %	16.7	11.3	12.2	15.1
Labour Force (000's)	245.6	258	237	223
Compound Growth	1.2%	0.3%	-0.2%	-0.6%
Population (000's)	538.8	532.2	514.2	496.4
Compound Growth	-0.2%	-0.1%	-0.3%	-0.5%
Average Output/PY ($92's)	57,928	69,751	73,186	71,939
Compound Growth	1.2%	1.17%	1.47%	1.36%
TFR	1.27	Trend to 1.4	Constant (1.27)	Trend to 1.0

* Percent Change is average compound growth rate from 1976 to 2000.

Presentations to SSP Boards and the Panel of Experts on Demography

The following are examples of presentations made by Beverley Carter, Linda Bartholomew, Dr. Doug May, and Ken Hicks during the consultations with the Strategic Social Plan (SSP) boards and the meeting of the Panel of Experts on Demography.

Beverley Carter's presentations to the SSP boards gave a general overview of past demographic trends in the province, a brief economic outlook for the province, a population projection consistent with the economic outlook and key implications of demographic trends. Linda Bartholomew and Dr. Doug May's presentations to the SSP boards gave an overview of recent demographic trends in the relevant region and then outlined the results of the Newfoundland Statistics Agency's MCP survey of out-migrants from this province. An example of their presentation to the Avalon SSP board is included.

Beverley Carter's presentation to the Panel of Experts on Demography was broken into two sections. The first section gave an overview of the demographic trends in Newfoundland and Labrador, focusing on natural population change and relevant economic and social factors affecting demographic trends. The second part of the presentation focused on migration and the factors relevant to it. Information on future labour market requirements and future aging of the population was also presented.

Linda Bartholomew made two presentations to the Panel of Experts on Demography. The first presentation covered regional patterns for fertility, female migration and natural population change. The second presentation outlined the Newfoundland Statistics Agency's Survey of Out-Migrants and presented some of the results from the survey.

Ken Hicks made two presentations to the Panel of Experts on Demography. The first presentation covered information on historical migration flows in and out of the Province. The second presentation outlined the assumptions behind three economic scenarios (high, medium, and low) for the province developed by the Department of Finance in consultation with Dr. Doug May. The implications of these economic projections for demographics and changing industry labour demands were also presented.

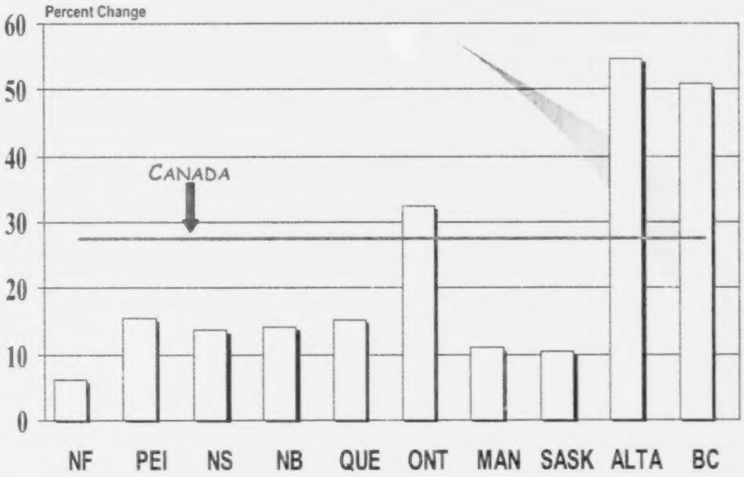
Demographic Change in Newfoundland and Labrador

Regional Consultations
December 2000/January 2001

Overview Of Presentation

- Demographic Study: Link to Consultation
- Historical Population Growth/Decline
  - In a Canadian comparative framework
- Other Demographic Trends Historically
  - Components of population change
  - Regional population shifts, Population Aging, etc.
- Economic Outlook in Brief
  - Economics/employment and demographics are linked
- Future Demographic Trends (One Possible Scenario)
  - Total population
  - Components of population
- Key Future Issues and Implications

Change In Total Population 1973-1993
Canada and the Provinces



Economics and Statistics Branch, Department of Finance

Change In Total Population 1993-2000
Canada and the Provinces

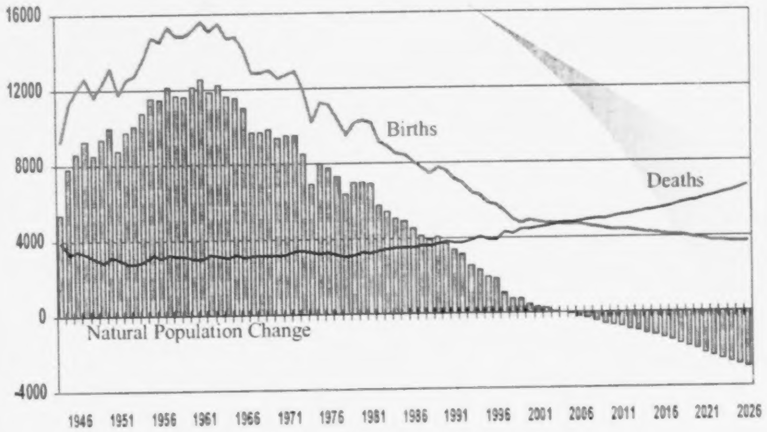
Components of Population Change

Natural Population Changes
Migration Changes

Natural Population Change
Newfoundland and Labrador: 1944-2026



Economics and Statistics Branch, Department of Finance

Factors Thought to Influence Migration Trends

PERSONAL CONSIDERATIONS
- Friends/Family in prospective destination

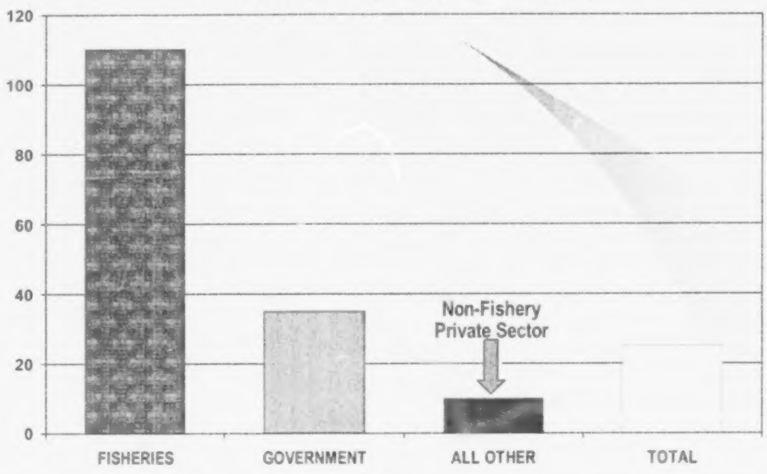
SOCIOECONOMIC STATUS
- Age/Education
- Marital/Occupational status
- Dependent Children/Home ownership status

ECONOMIC FACTORS
- Employment prospects (home community/elsewhere)
- Industry failure (e.g., collapse of groundfishery)
- Hiring practices of fish plant in community
- Workforce age structure (attrition profile in future)
- Business cycle (e.g., recession, economic growth)

GOVERNMENT PROGRAMS AND POLICIES
- UI/EI/Makework program and policy change
- Government Spending/Presence/Municipal Financing
- Fisheries Policy

Economics and Statistics Branch, Department of Finance

Employment Growth, Mid-70s to Late-80s
Newfoundland and Labrador



Non-Fishery Private Sector

Summary of Economic Outlook
Newfoundland and Labrador: % Change 1999-2026

Indicator	Annual Average	Cumulative
Real GDP	**1.5**	**49.1**
Employment	**0.6**	**15.7**
Real Personal Income	**1.4**	**45.7**

PER CAPITA:
Growth rates per capita will be about the same since population is projected to be stable over the 1999-2026 forecast period.

Labour Market Requirements & Migration
1999 versus 2026

127,500 of the total employed in 1999 were 35 years and up
(all 62+ by 2026 and most will be retired)

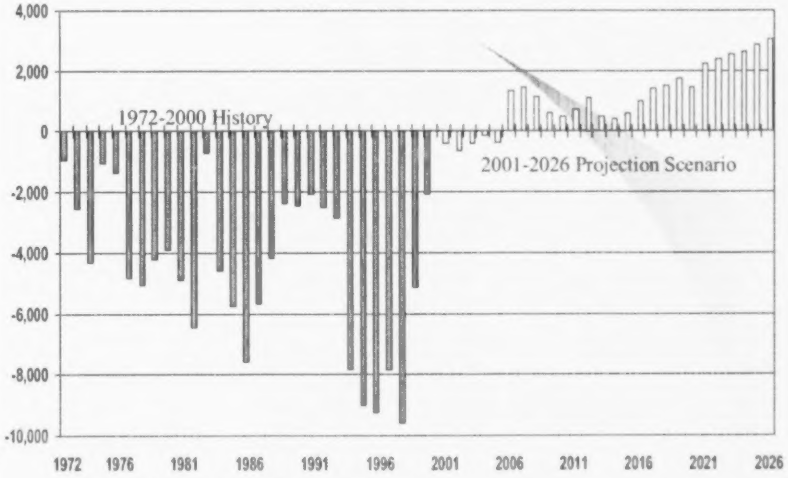
32,500 net new jobs by 2026 (under this scenario … may change)
(15.7% cumulative employment gain)

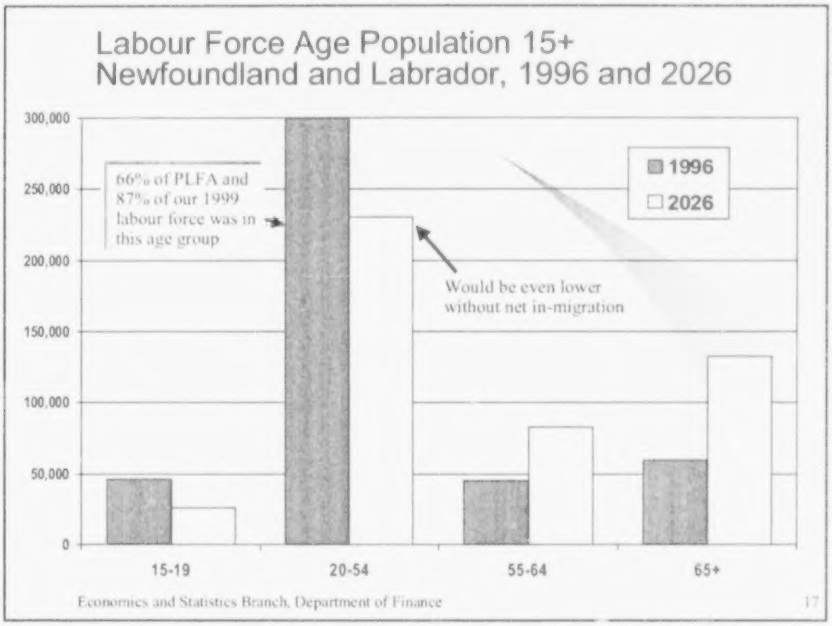
160,000 person years of employment to be filled by 2026
(probably over 200,000 different people)

UNDER THIS SCENARIO:

Province will need net in-migration to meet the demand for workers, otherwise employment will have to decline substantially.

Net-Migration
Newfoundland and Labrador: 1972 to 2026





Labour Force Age Population 15+ Newfoundland and Labrador, 1996 and 2026

66% of PLFA and 87% of our 1999 labour force was in this age group

Would be even lower without net in-migration

What is Population Change?

Population in 1996 =

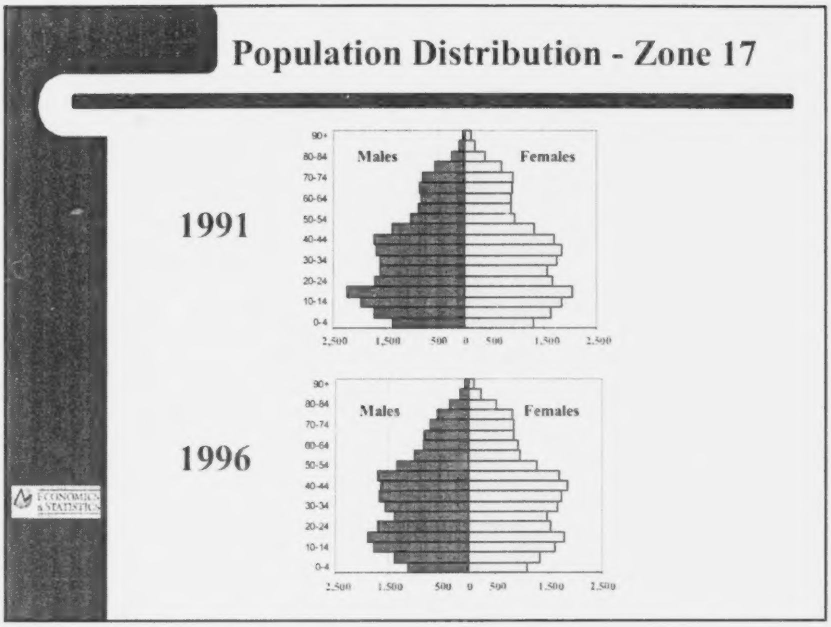
Population in 1991

+ **Births** between 1991 and 1996

- **Deaths** between 1991 and 1996

+ **Net Migration** between 1991 and 1996

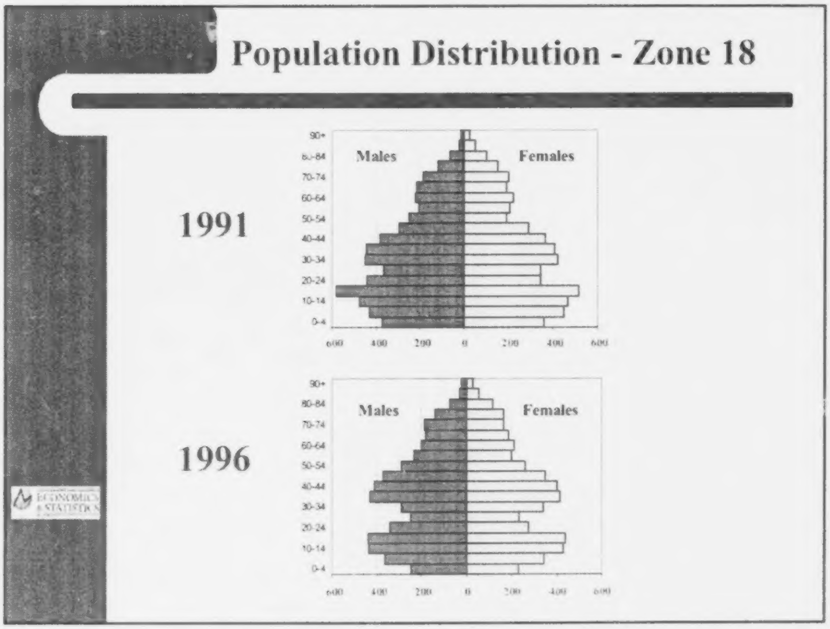
- Net Migration = In-Migration - Out-Migration



Population Distribution - Zone 17

1991

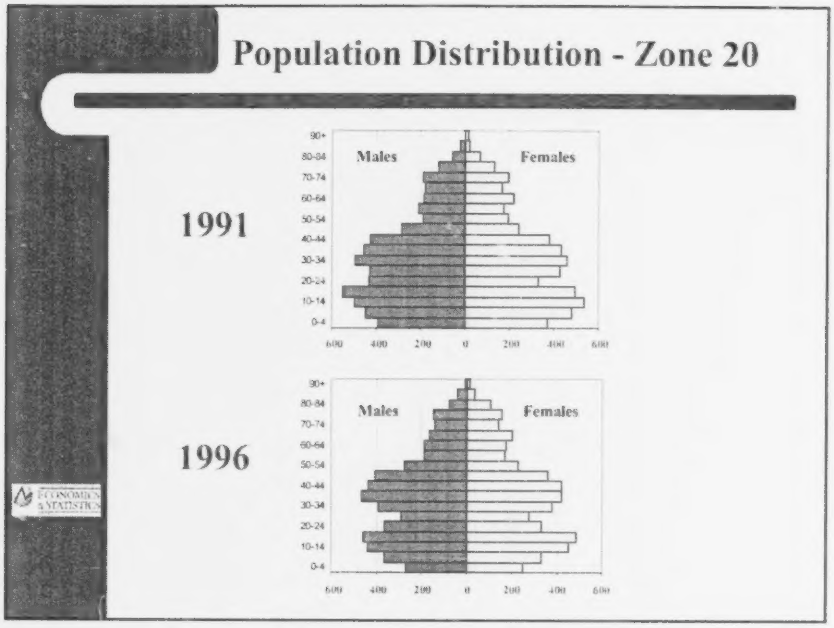
1996



Population Distribution - Zone 18

1991

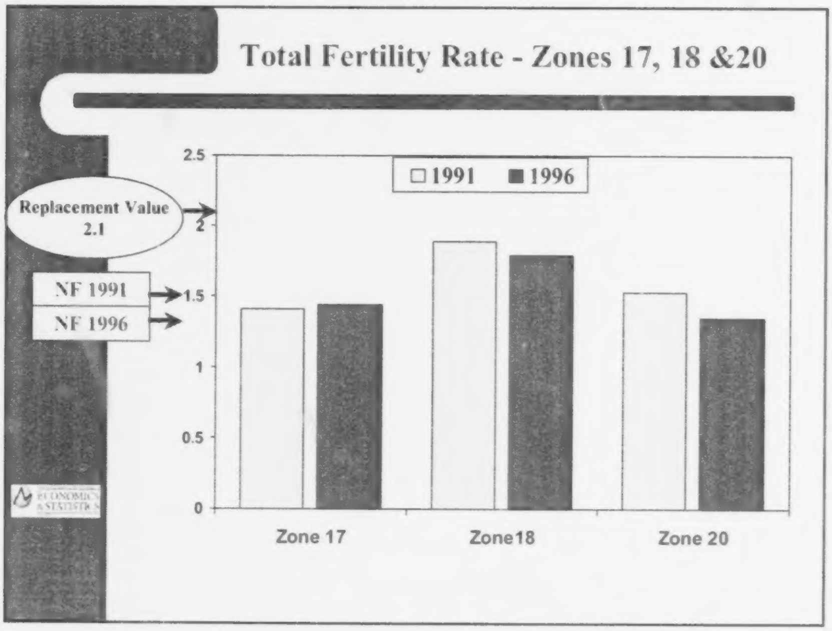
1996



Population Distribution - Zone 20

1991

1996



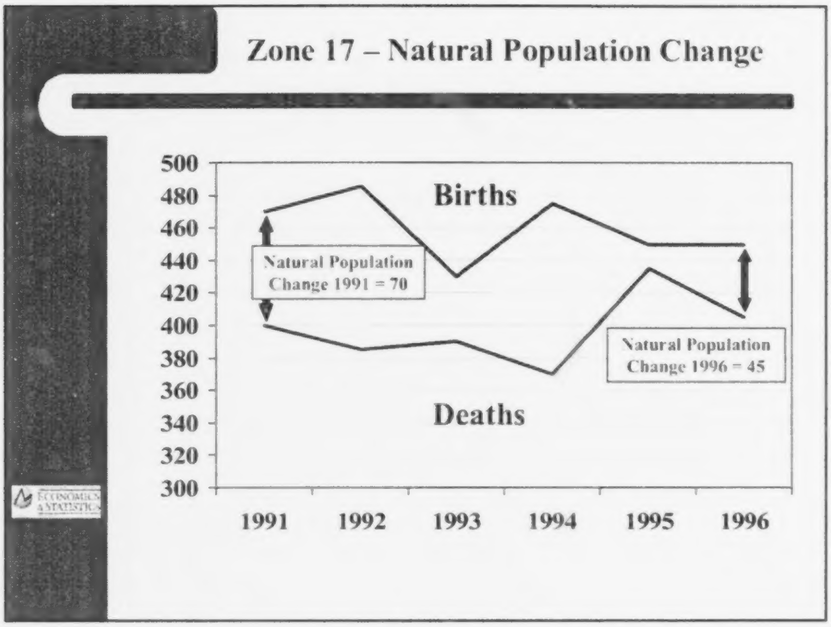
Total Fertility Rate - Zones 17, 18 &20

Replacement Value 2.1

NF 1991

NF 1996

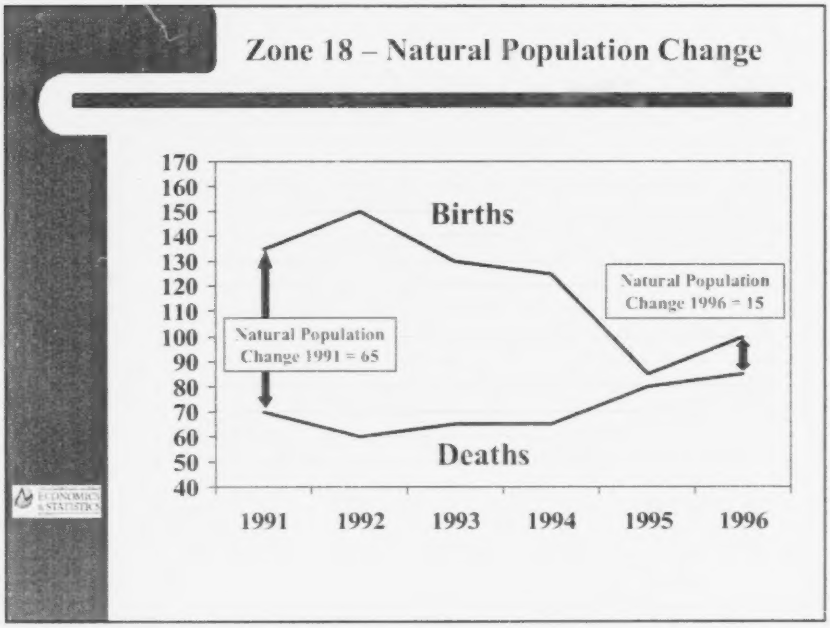
Zone 17 – Natural Population Change



Natural Population Change 1991 = 70

Natural Population Change 1996 = 45

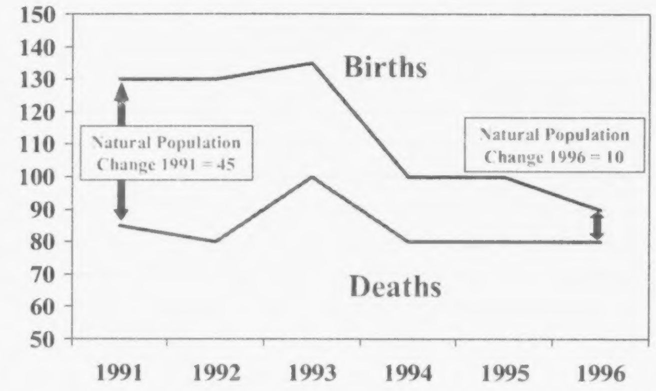
Zone 18 – Natural Population Change



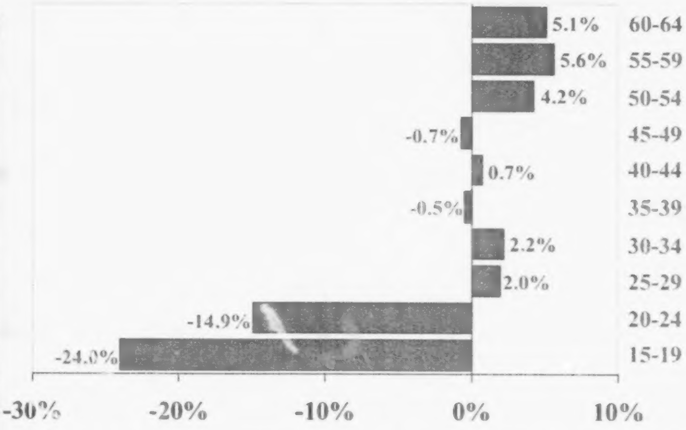
Natural Population Change 1996 = 15

Natural Population Change 1991 = 65

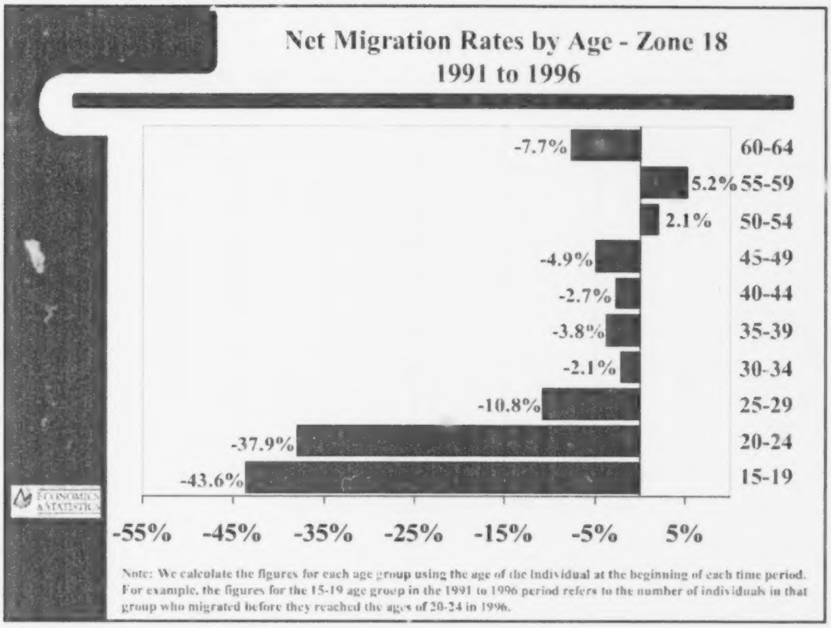
Zone 20 – Natural Population Change



Net Migration Rates by Age - Zone 17 1991 to 1996

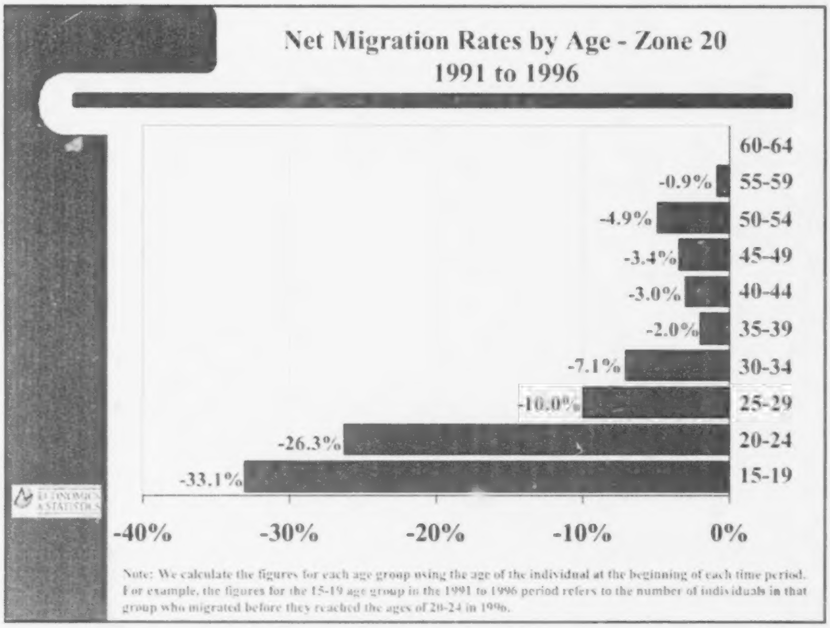


Note: We calculate the figures for each age group using the age of the individual at the beginning of each time period. For example, the figures for the 15-19 age group in the 1991 to 1996 period refers to the number of individuals in that group who migrated before they reached the ages of 20-24 in 1996.



Net Migration Rates by Age - Zone 18
1991 to 1996

Note: We calculate the figures for each age group using the age of the individual at the beginning of each time period. For example, the figures for the 15-19 age group in the 1991 to 1996 period refers to the number of individuals in that group who migrated before they reached the ages of 20-24 in 1996.



Net Migration Rates by Age - Zone 20
1991 to 1996

Note: We calculate the figures for each age group using the age of the individual at the beginning of each time period. For example, the figures for the 15-19 age group in the 1991 to 1996 period refers to the number of individuals in that group who migrated before they reached the ages of 20-24 in 1996.

Characteristics of Migrants

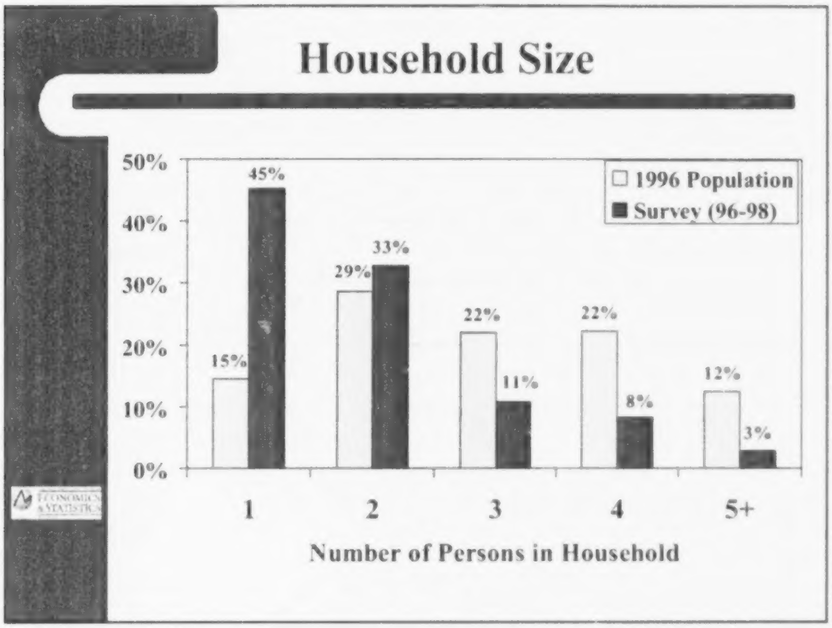
The Newfoundland Statistics Agency is conducting an ongoing survey of people leaving Newfoundland and Labrador.

Among the questions asked are:

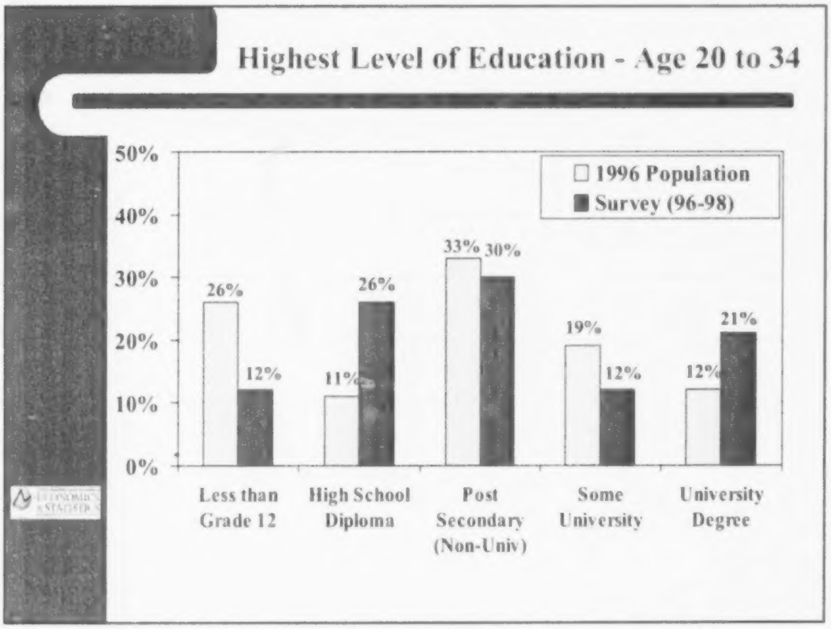
- Reason for Leaving
- Household Size
- Level of Education
- Labour Market Status

Reason for Leaving

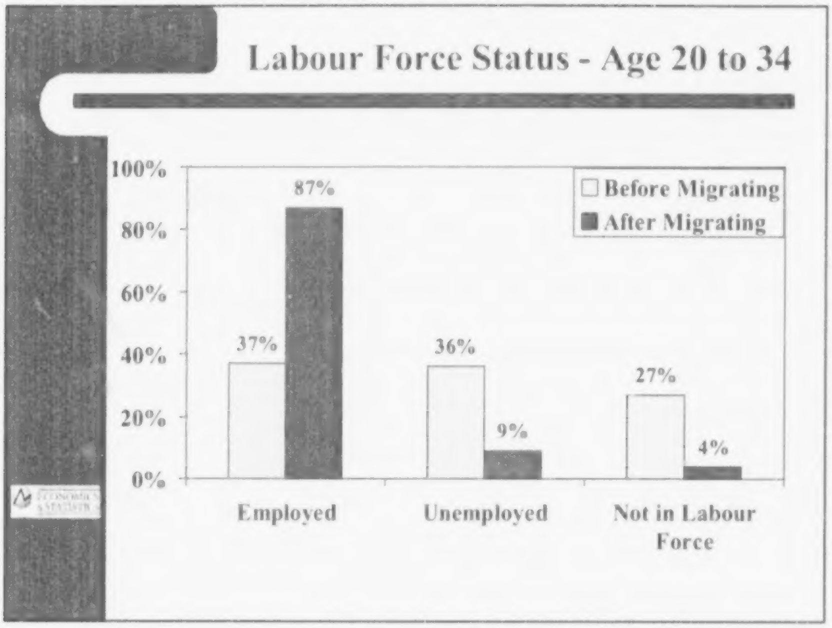
Reason for Leaving	%
Job Related	76%
Transfer	6%
New job	21%
Look for work	49%
Family	17%
Other	7%
Total	100%



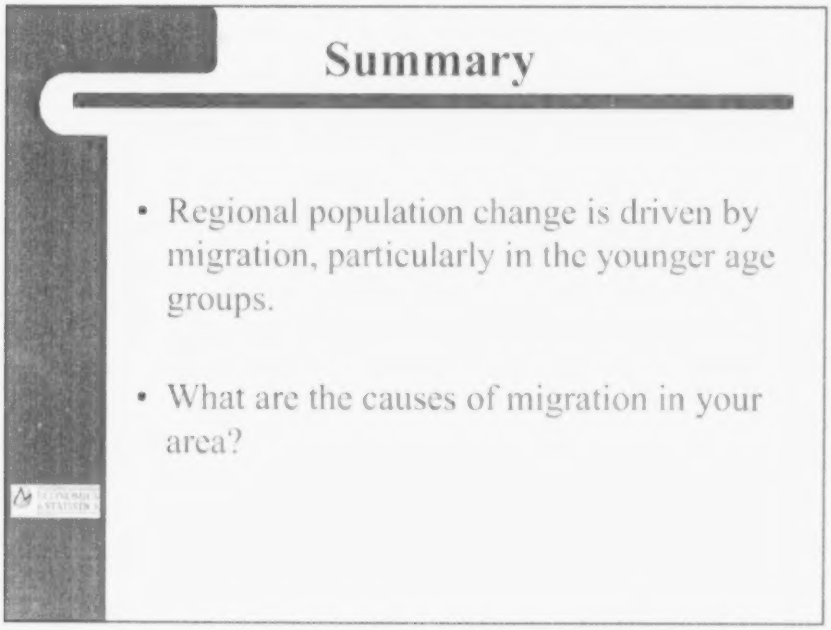
Household Size



Highest Level of Education - Age 20 to 34



Labour Force Status - Age 20 to 34



Summary

- Regional population change is driven by migration, particularly in the younger age groups.
- What are the causes of migration in your area?

LONG TERM POPULATION PROJECTIONS FOR
NEWFOUNDLAND AND LABRADOR:
A Consultative Approach
DRAFT #2 — Final Report

A Joint Project Between
Economics and Statistics Branch, Department of Finance
and
Planning and Coordination Division, Atlantic Canada Opportunities Agency
(November 2001)

Dr. Doug May

Dr. May is Professor of Economics at Memorial University with cross-appointments in the Faculty of Business and the Division of Community Health in the Faculty of Medicine. He is currently a director of the John Deutsch Institute for Policy Analysis at Queen's and on the Board of Research Advisors for the Atlantic Institute for Market Studies. His past research efforts have been in the areas of applied production theory, productivity, and business tax incentives as well as the economic impacts of unemployment insurance and social assistance.

Professor May is currently acting as an advisor to the Newfoundland Statistics Agency and the Executive Council of the Government of Newfoundland and Labrador on the Strategic Social Plan. Over the past couple of years he has been working with ACOA and the Economics and Statistics Branch of the Provincial Government's Department of Finance to produce demographic projections for the province and its regions.

Francois Nault

François Nault is currently Chief of the Demographic Estimates Section in the Demography Division at Statistics Canada. He has obtained a M.Sc. in demography from the University of Montreal in 1983 and has been with Statistics Canada since 1990. He has worked on the production of population estimates and projections as well as health statistics. He has published several papers on the topics of population modelling, mortality, life expectancy, fertility and population ageing.

Dr. Dane Rowlands

Dane Rowlands received his PhD in economics from the University of Toronto. His research in international development finance, multilateral financial institutions, and peacekeeping have appeared in journals such as the Journal of International Economics, Journal of Conflict Resolution, Review of International Economics, and Journal of Development Studies. He has published work on international migration in World Development and Canadian Foreign Policy, and has conducted research into intra-national and international migration on behalf of the Government of Newfoundland and Labrador, Citizenship and Immigration Canada, and the United Nations and various agencies related to it. He has taught at Memorial University and the University of Ottawa, and is currently Associate Professor of International Affairs at Carleton University.

Dr. Byron Spencer

Byron G. Spencer, BA, PhD, is Professor of Economics and Director of the Research Institute for Quantitative Studies in Economics and Population at McMaster University. His areas of specialization include economic demography, applied econometrics, and health economics. Most of his time is now spent on the Social and Economic Dimensions of an Aging Population (SEDAP) Research Program, a SSHRC-funded Major Collaborative Research Initiative program centred at McMaster, of which he is the principal investigator.

Dr. Roy West

Dr. West is currently Associate Dean for Community Health in the Faculty of Medicine, Memorial University. He chairs the Canadian Immunization Awareness Program, a coalition of Canadian health professional associations committed to the promotion of immunization in Canada. Also, he serves as President of the National Cancer Institute of Canada.

Roy West commenced his career in the Southampton Laboratory of the British Public Health Laboratory Service in 1953. Since that time, he has had a variety of public health experiences in England, East Africa and Canada. Since coming to Canada in 1969, he has been employed at McGill University, Montreal; Laboratory Centre for Disease Control, Ottawa, Saskatchewan Health, Regina; and Memorial University, St. John's.

Roy moved to Memorial University in March 1991 as Professor of Epidemiology in the Faculty of Medicine and Professor of Microbiology in the School of Pharmacy. During his ten years in Saskatchewan, he served initially as Provincial Peidemiologist, then as Executive Director of Laboratory and Disease Control Services and, finally, as Associate Deputy Minister for Community Health. In the latter role, he enjoyed his work with the public health regions and community-based organizations in Saskatchewan.

He possesses a MSc in Microbiology and Immunology and a PhD in Epidemiology, both from McGill University.

His research interests are in population health including determinants of health, communicable disease control, pharmacoepidemiology and health policy.

He was recently awarded the Defries Award by the Canadian Public Health Association for his service to public health in Canada.

Dr. Stanley L. Winer

Professor, School of Public Administration and Department of Economics

Carleton University

Professor Winer has taught at Carnegie-Mellon University, The University of Western Ontario, the People's University of China, Beijing and the Ministry of Finance, Hanoi. He has held research fellowships at Statistics Canada, the Research School of the Social Sciences, Australian National University and at the University of Montreal. Professor Winer concentrates his research in three areas: the integration of economics and collective choice theory in the analysis of taxation and public expenditures; the empirical analysis of internal migration and its relationship to public policy; and the economics and politics of federalism.

Professor Winer holds an M.A. and a Ph.D. in Economics from the John's Hopkins University.

He has published widely in international journals and collected volumes, including the recently issued handbook of public choice (Cambridge 1997). He is the co-author with Walter Hettich of "Democratic Choice and Taxation: A Theoretical and Empirical Analysis", published by Cambridge University Press in 1999.

Professor Winer is currently a vice-president of the International Institute of Public Finance, and chair of its scientific committee for the 57th Congress of the IIPF to be held in Austria in August 2001. He has been an elected member of the management board of the Canadian Economics Association. He was the first supervisor of the Ph.D. Program in Public Policy at Carleton University, and was a founding co-organizer of the Canadian Public Economics Study Group. He has served as a consultant to various government agencies.

(November 2001)

Presentations to SSP Boards and the Panel of Experts on Demography

The following are examples of presentations made by Beverley Carter, Linda Bartholomew, Dr. Doug May, and Ken Hicks during the consultations with the Strategic Social Plan (SSP) boards and the meeting of the Panel of Experts on Demography.

Beverley Carter's presentations to the SSP boards gave a general overview of past demographic trends in the province, a brief economic outlook for the province, a population projection consistent with the economic outlook and key implications of demographic trends. Linda Bartholomew and Dr. Doug May's presentations to the SSP boards gave an overview of recent demographic trends in the relevant region and then outlined the results of the Newfoundland Statistics Agency's MCP survey of out-migrants from this province. An example of their presentation to the Avalon SSP board is included.

Beverley Carter's presentation to the Panel of Experts on Demography was broken into two sections. The first section gave an overview of the demographic trends in Newfoundland and Labrador, focusing on natural population change and relevant economic and social factors affecting demographic trends. The second part of the presentation focused on migration and the factors relevant to it. Information on future labour market requirements and future aging of the population was also presented.

Linda Bartholomew made two presentations to the Panel of Experts on Demography. The first presentation covered regional patterns for fertility, female migration and natural population change. The second presentation outlined the Newfoundland Statistics Agency's Survey of Out-Migrants and presented some of the results from the survey.

Ken Hicks made two presentations to the Panel of Experts on Demography. The first presentation covered information on historical migration flows in and out of the Province. The second presentation outlined the assumptions behind three economic scenarios (high, medium, and low) for the province developed by the Department of Finance in consultation with Dr. Doug May. The implications of these economic projections for demographics and changing industry labour demands were also presented.

Demographic Change in Newfoundland and Labrador

Prepared for
Panel of Experts – January 2001
Department of Finance
Government of Newfoundland & Labrador

Overview Of Presentation

- Demographic Study and Consultation Process
- Historical Population Growth/Decline
  - Canadian comparative framework
- Historical Demographic Trends
  - Components of population change
  - Population aging
  - Regional population trends
- Economic Outlook in Brief
  - Economics/employment/demographics linkages
- Future Demographic Trends (Illustrative Scenario)
  - Total population
  - Components of population
- Key Future Issues and Implications

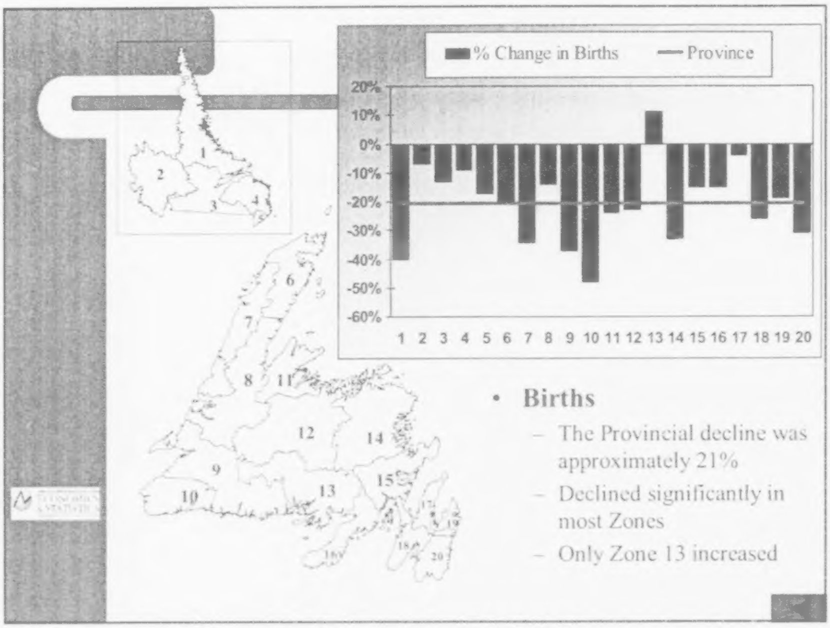
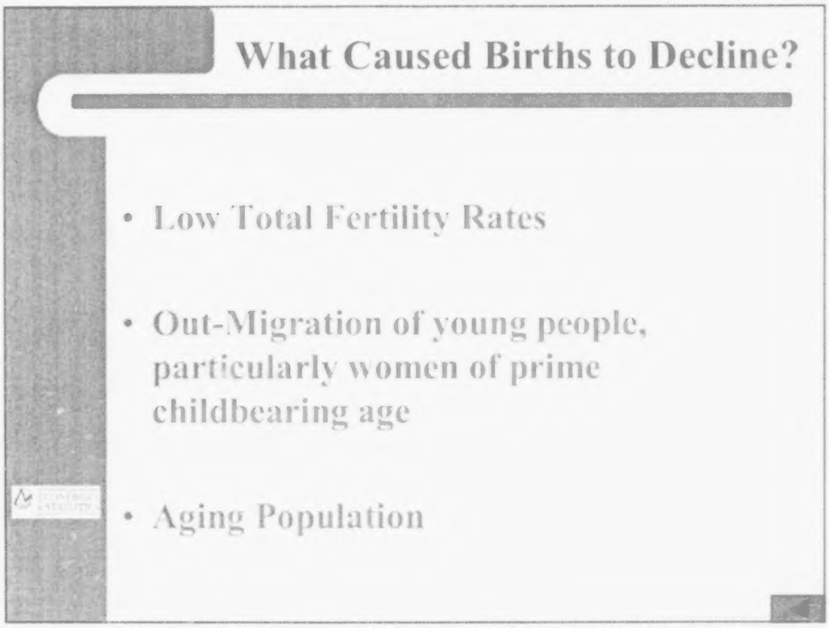
OUTLINE

- Change in Number of Births
- Total Fertility Rate
- Mean Age of Fertility
- Migration Rates of Females
- Natural Population Change

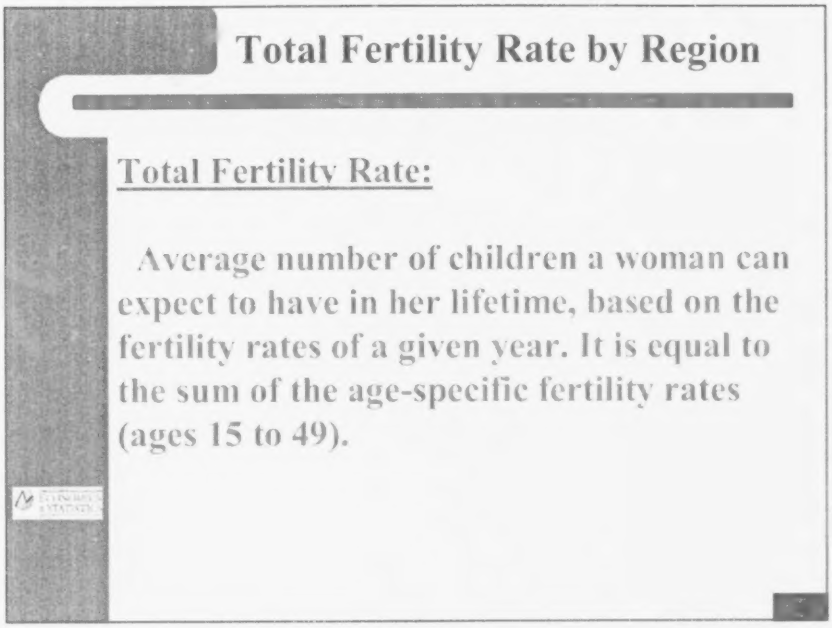


- **Births**
  - The Provincial decline was approximately 21%
  - Declined significantly in most Zones
  - Only Zone 13 increased



What Caused Births to Decline?

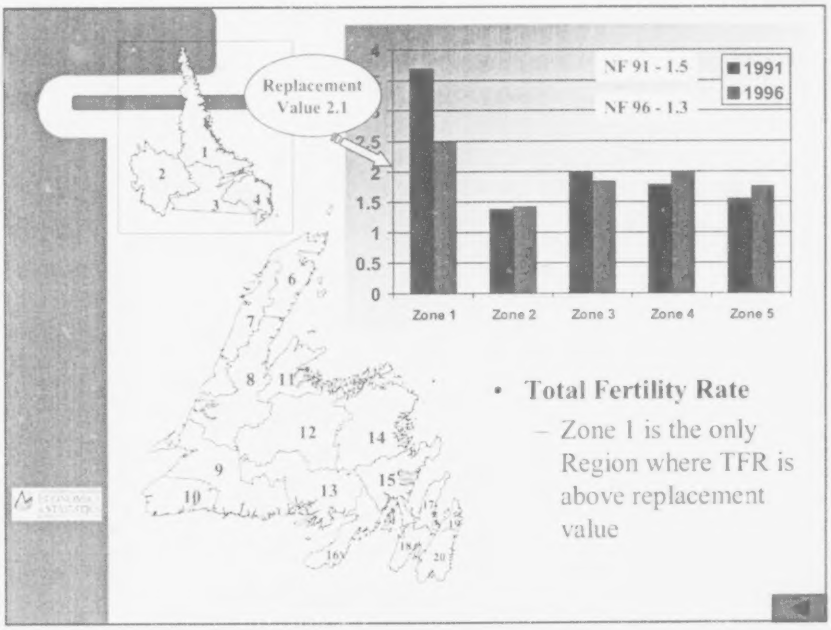
- Low Total Fertility Rates
- Out-Migration of young people, particularly women of prime childbearing age
- Aging Population



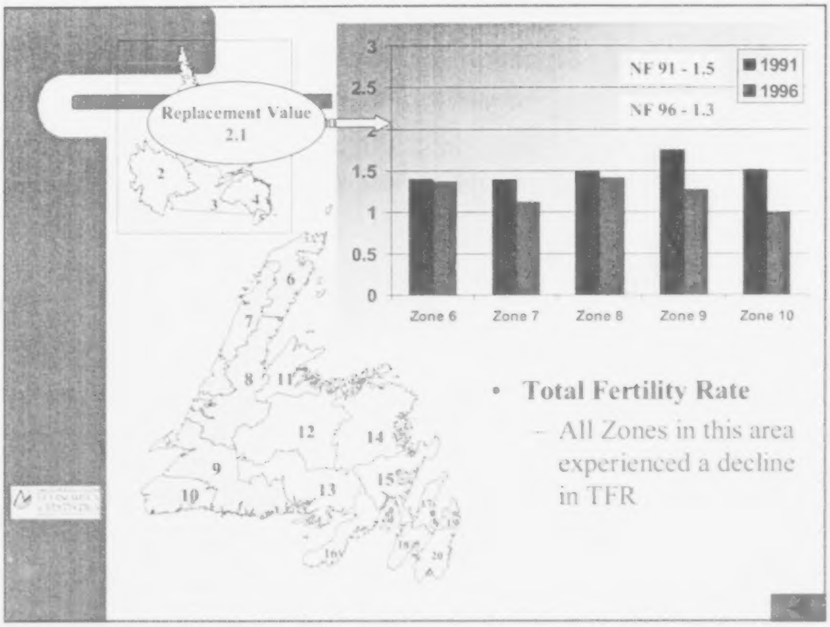
Total Fertility Rate by Region

Total Fertility Rate:

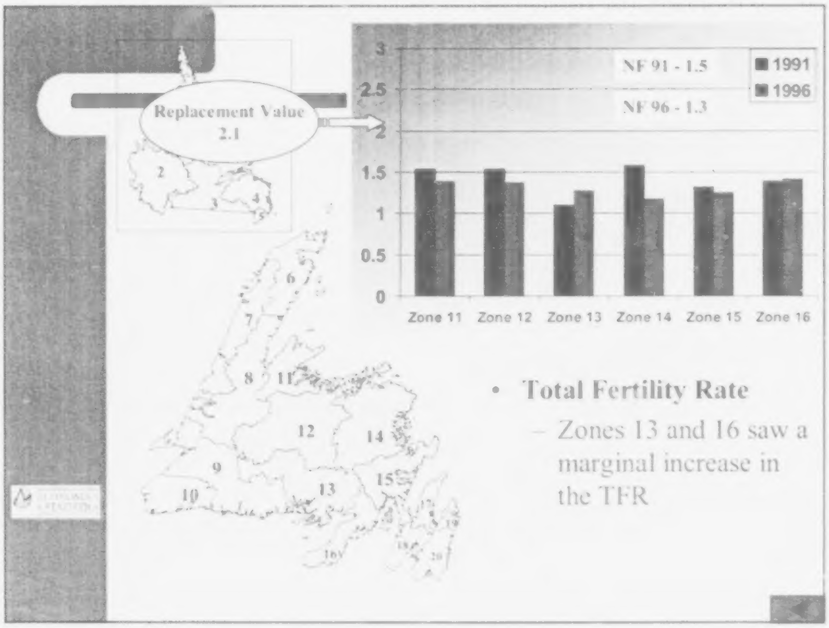
Average number of children a woman can expect to have in her lifetime, based on the fertility rates of a given year. It is equal to the sum of the age-specific fertility rates (ages 15 to 49).



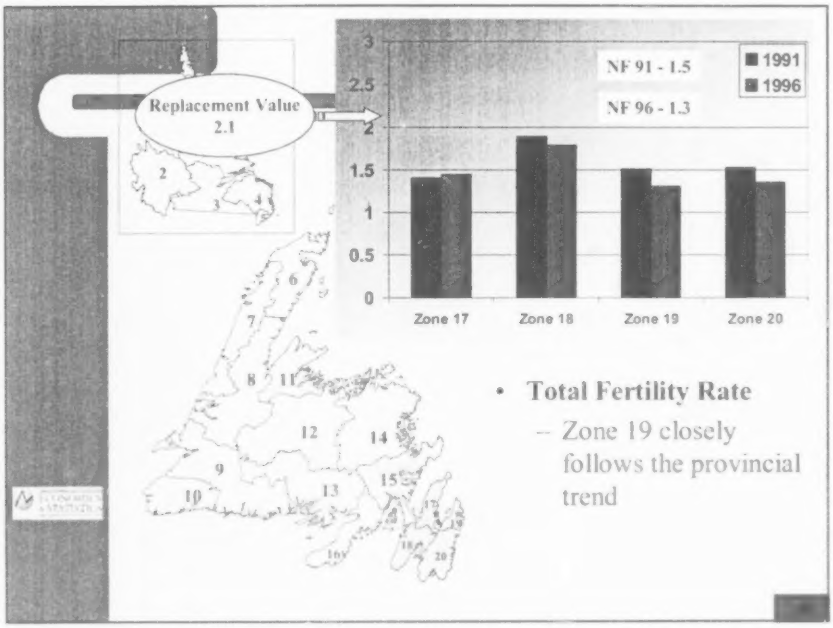
- **Total Fertility Rate**
  - Zone 1 is the only Region where TFR is above replacement value



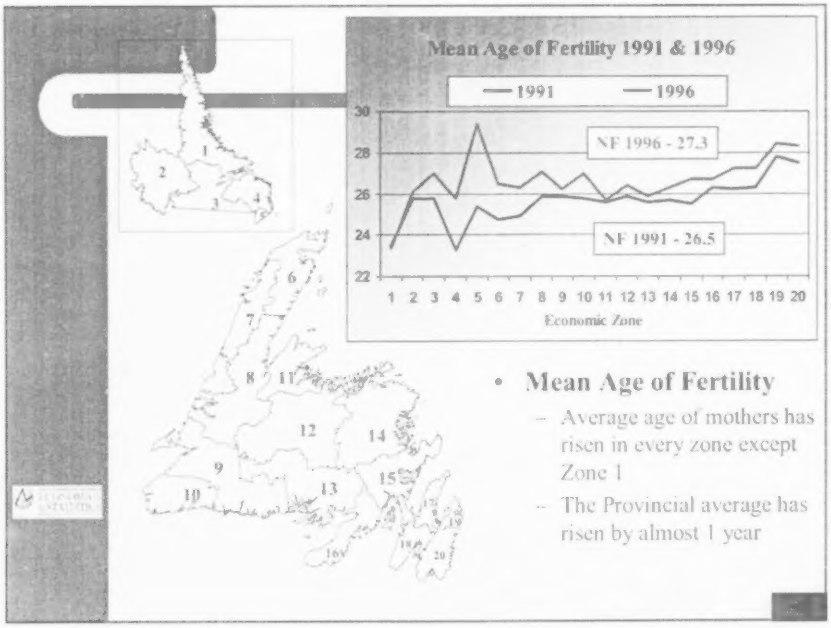
- **Total Fertility Rate**
  - All Zones in this area experienced a decline in TFR



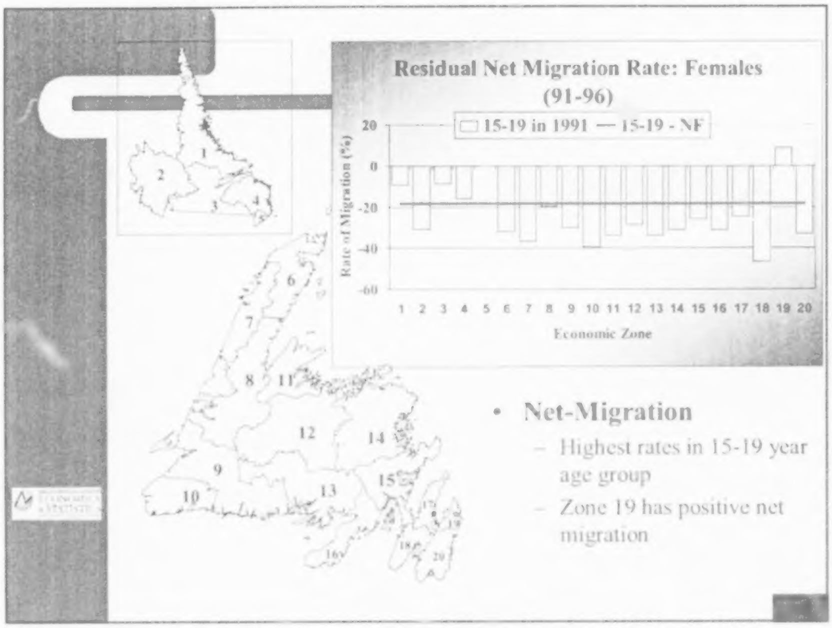
- **Total Fertility Rate**
  - Zones 13 and 16 saw a marginal increase in the TFR



- **Total Fertility Rate**
  - Zone 19 closely follows the provincial trend

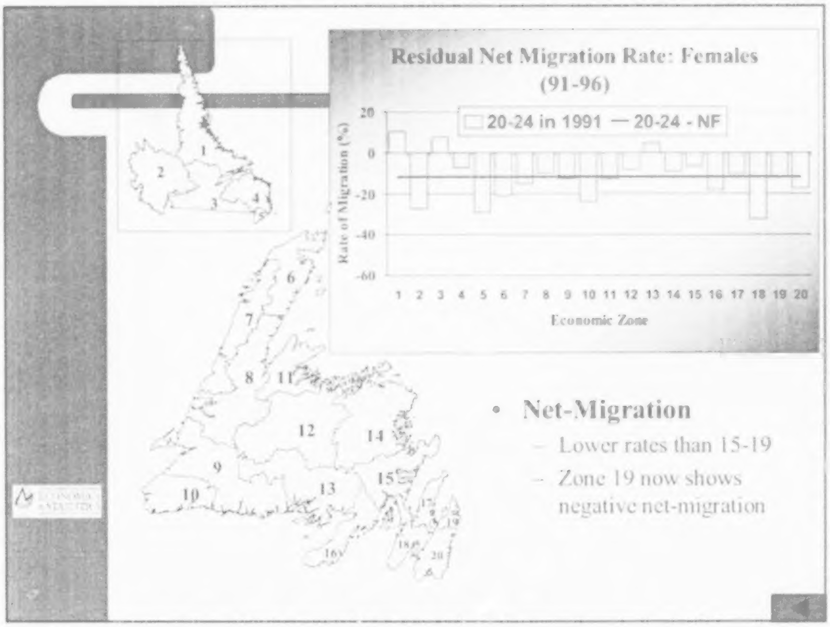


- **Mean Age of Fertility**
  - Average age of mothers has risen in every zone except Zone 1
  - The Provincial average has risen by almost 1 year



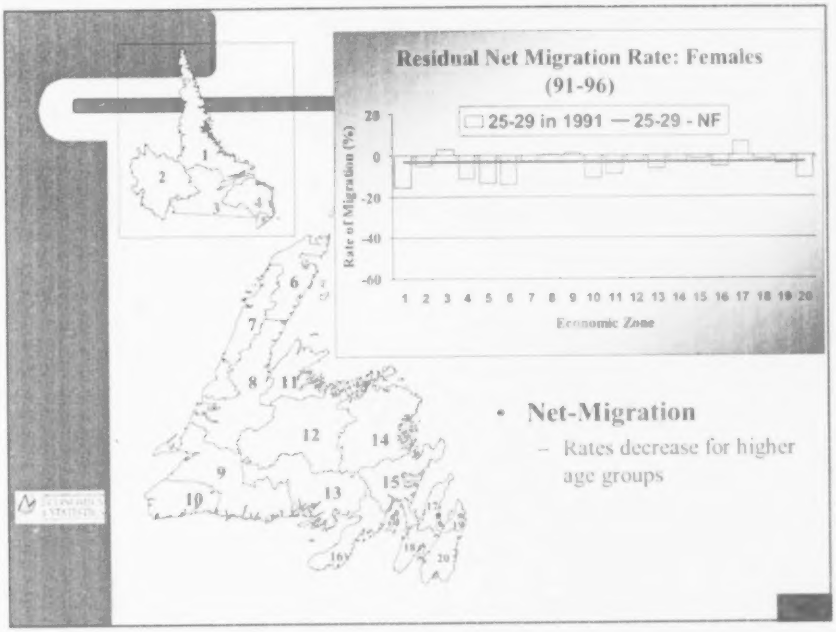
Residual Net Migration Rate: Females (91-96)

- **Net-Migration**
  - Highest rates in 15-19 year age group
  - Zone 19 has positive net migration



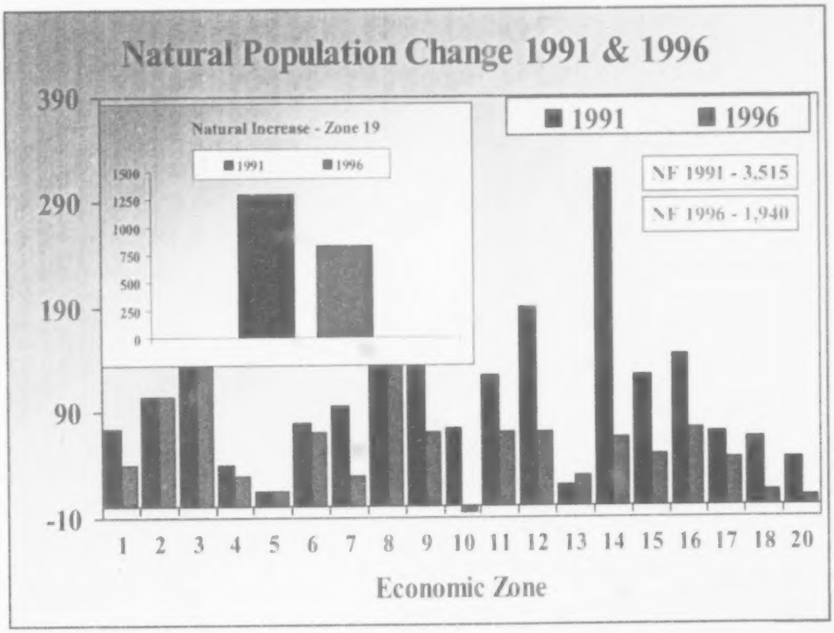
Residual Net Migration Rate: Females (91-96)

- **Net-Migration**
  - Lower rates than 15-19
  - Zone 19 now shows negative net-migration



Residual Net Migration Rate: Females (91-96)

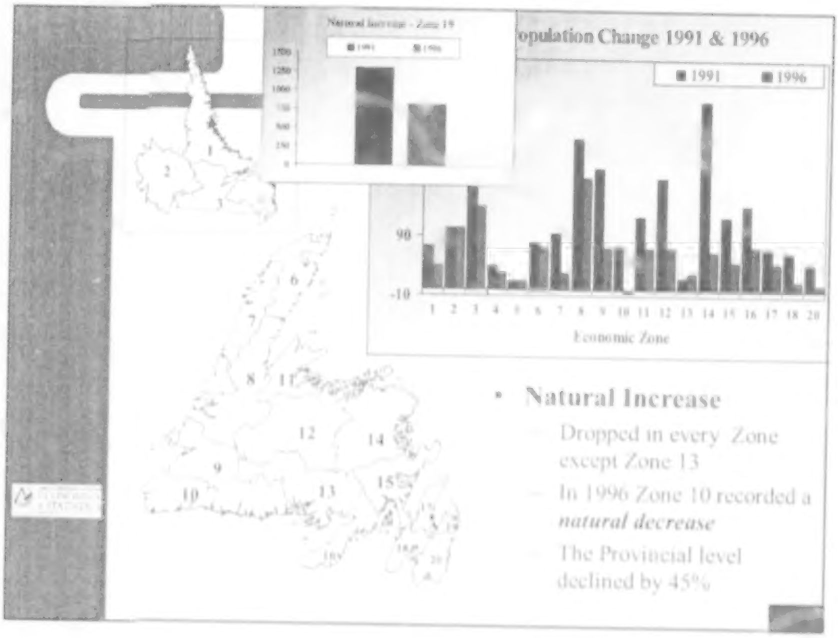
- **Net-Migration**
  - Rates decrease for higher age groups



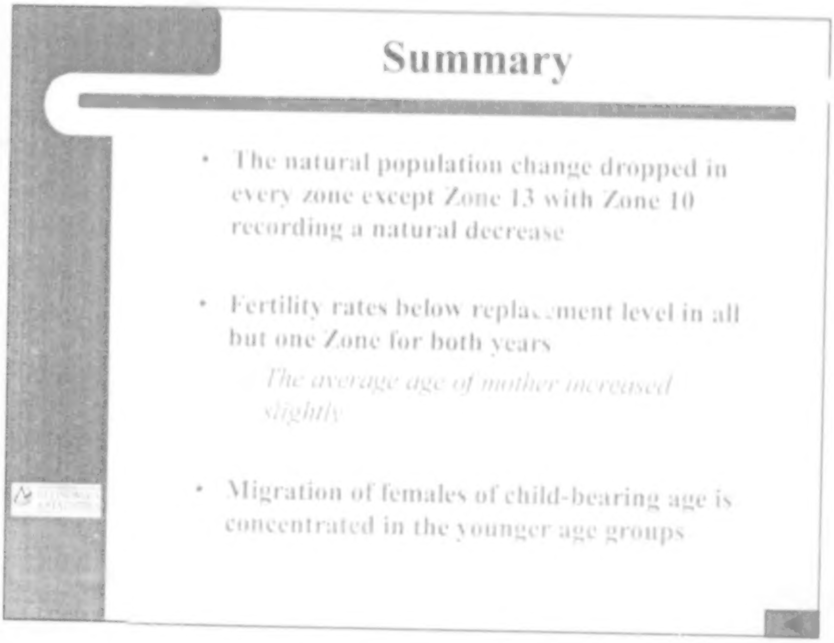
Natural Population Change 1991 & 1996

NF 1991 - 3,515

NF 1996 - 1,940



- **Natural Increase**
  - Dropped in every Zone except Zone 13
  - In 1996 Zone 10 recorded a ***natural decrease***
  - The Provincial level declined by 45%



Summary

- The natural population change dropped in every zone except Zone 13 with Zone 10 recording a natural decrease
- Fertility rates below replacement level in all but one Zone for both years
  - *The average age of mother increased slightly*
- Migration of females of child-bearing age is concentrated in the younger age groups

Demographic Projections

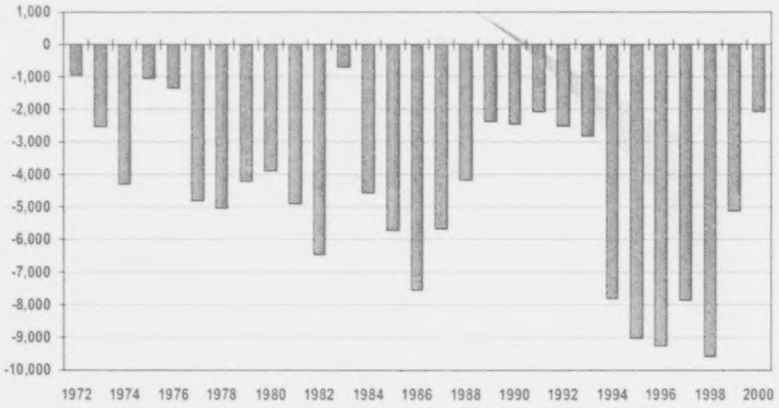
Components of Population Change Newfoundland and Labrador

Migration

Change in Population by Component Newfoundland and Labrador



Factors Thought to Influence Migration Trends

PERSONAL CONSIDERATIONS
- Friends/Family in prospective destination

SOCIOECONOMIC STATUS
- Age/Education
- Marital/Occupational status
- Dependent Children/Home ownership status

ECONOMIC FACTORS
- Employment prospects (home community/elsewhere)
- Industry failure (e.g., collapse of groundfishery)
- Hiring practices of fish plant in community
- Workforce age structure (attrition profile in future)
- Business cycle (e.g., recession, economic growth)

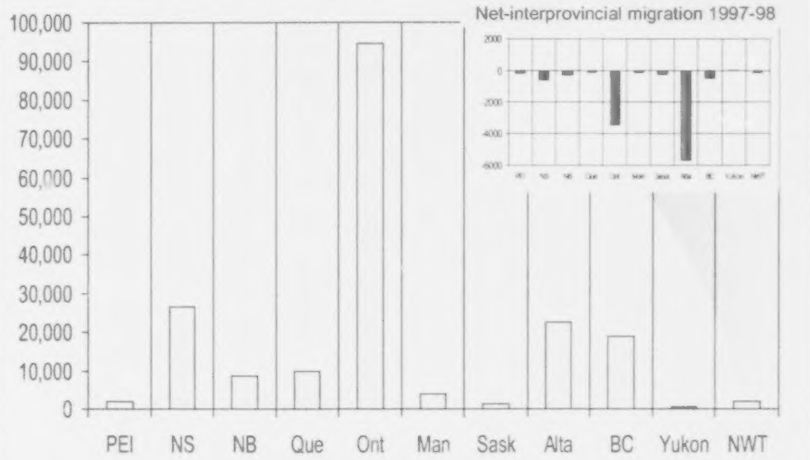
GOVERNMENT PROGRAMS AND POLICIES
- UI/EI/Makework program and policy change
- Government Spending/Presence/Municipal Financing
- Fisheries Policy

Personal Considerations

PERSONAL CONSIDERATIONS

Friends/Family in Prospective Destination

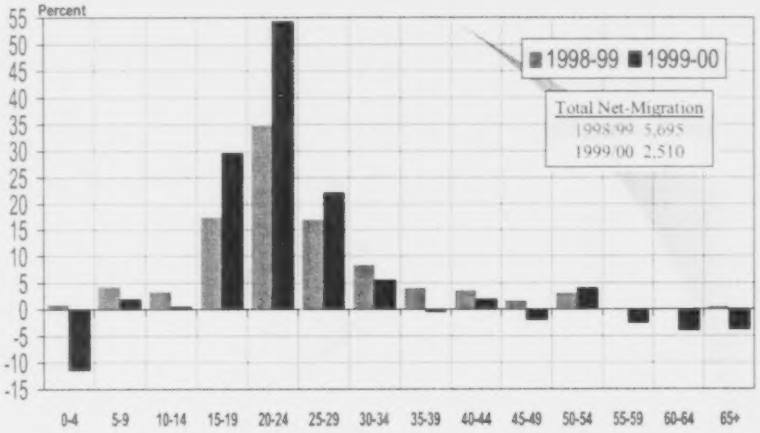
Canadians born in Newfoundland but living in other parts of Canada in 1996



Socioeconomic Status

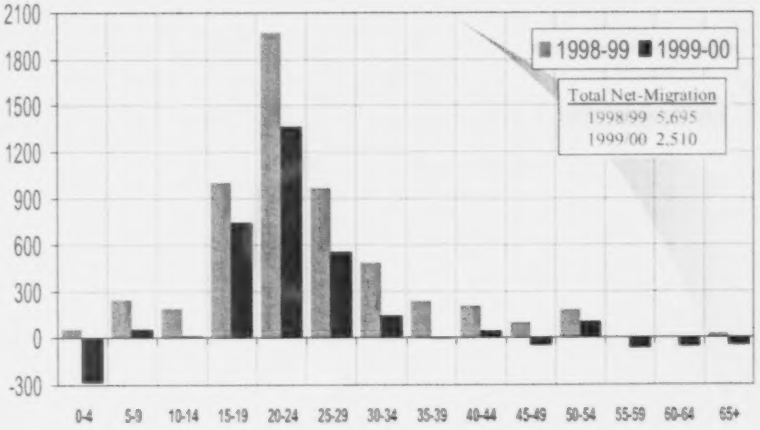
SOCIOECONOMIC STATUS: Age

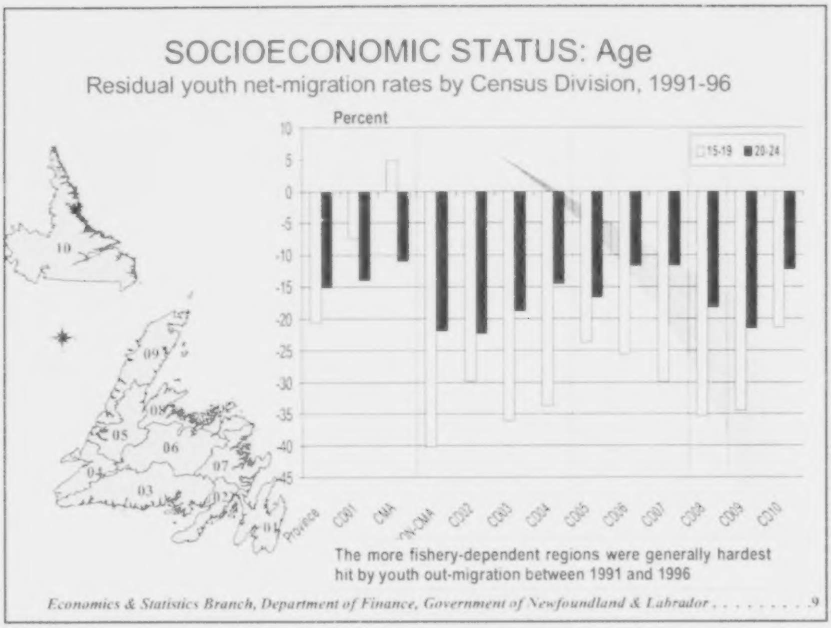
95% of net out-migrants in 1998-2000 were 29 or less



SOCIOECONOMIC STATUS: Age

95% of net out-migrants in 1998-2000 were 29 or less

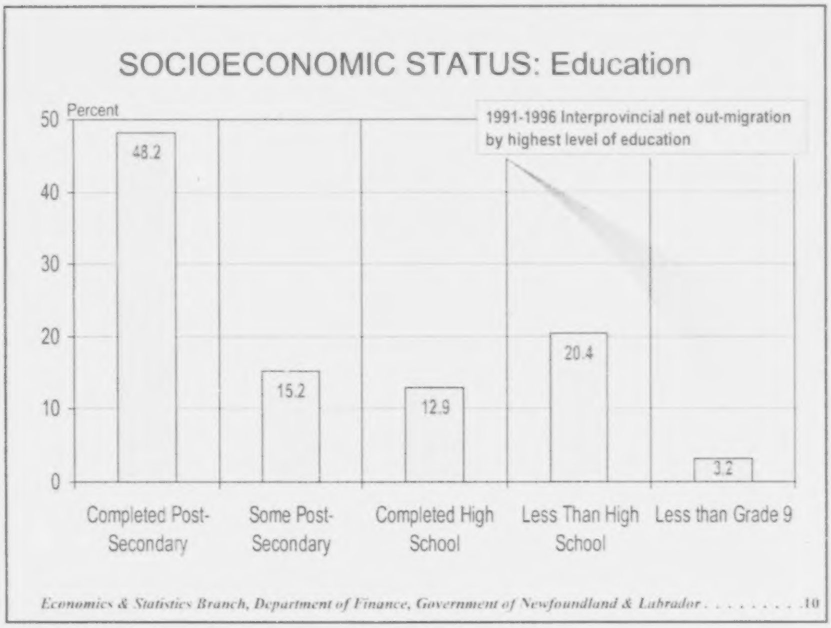




SOCIOECONOMIC STATUS: Age

Residual youth net-migration rates by Census Division, 1991-96

The more fishery-dependent regions were generally hardest hit by youth out-migration between 1991 and 1996

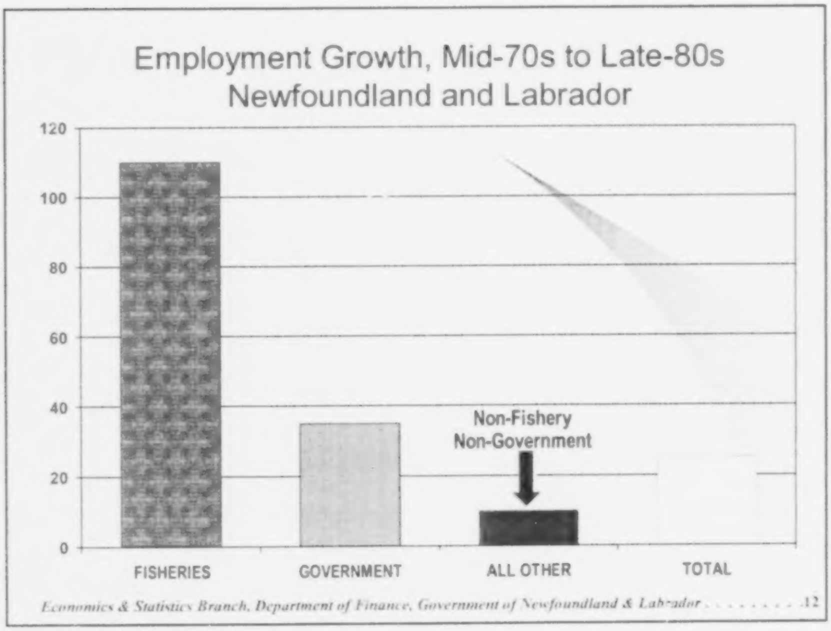


SOCIOECONOMIC STATUS: Education

1991-1996 Interprovincial net out-migration by highest level of education

Factors Thought to Influence Migration

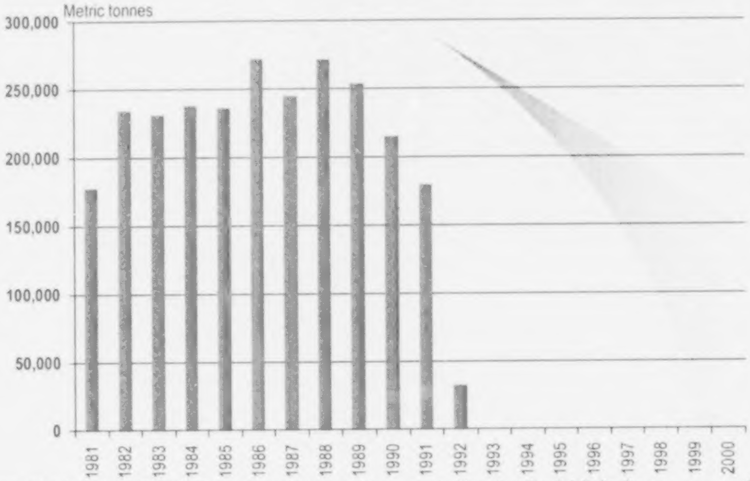
Economic Factors



Employment Growth, Mid-70s to Late-80s Newfoundland and Labrador

ECONOMIC FACTORS: 2J+3KL Landings

(Northern Cod Stock)



Population Change By Census Division

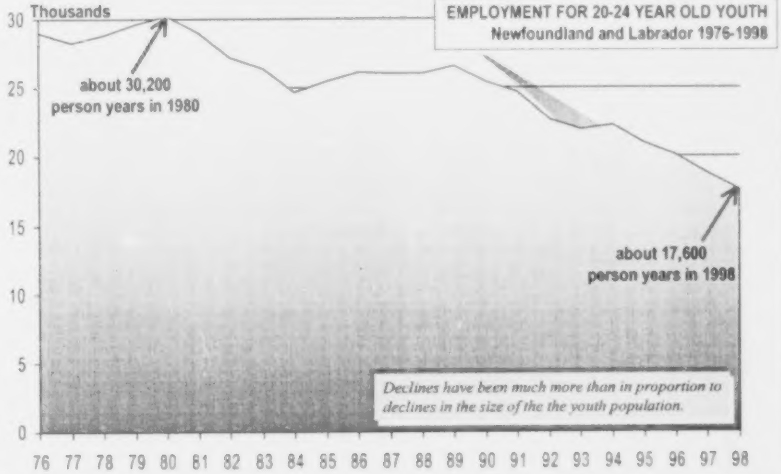
Newfoundland and Labrador 1991-1996

Census Division	<1,000	1,000 -4,999	5,000+	Total	1991 Fishery as % of Total Labour Force
CD-01 Avalon Peninsula	-5.5	-2.9	0.9	-0.7	7.4
CD-02 Burin Peninsula	-7.5	-6.9	0.0	-5.5	30.3
CD-03 South Coast	-7.6	-7.2	-7.1	-7.3	35.3
CD-04 St. George's	-9.3	0.7	1.9	-3.4	6.4
CD-05 Humber District	-2.9	-3.3	-1.7	-2.2	4.4
CD-06 Central	-3.7	-4.2	-2.0	-2.8	0.1
CD-07 Bonavista/Trinity	-8.0	-4.4	19.3	-3.8	23.2
CD-08 Notre Dame Bay	-7.6	-6.0	n/a	-7.0	22.4
CD-09 Northern Peninsula	-9.6	-6.0	n/a	-8.7	34.8
CD-10 Labrador	-3.0	-13.4	-3.2	-3.9	6.6
TOTAL PROVINCE	-6.8	-4.6	0.3	-2.9	12.3

n/a Not applicable; no community of this size in the Census Division

ECONOMIC FACTORS: Youth Employment

the fishery was a significant employer of young people in the 1970s and 1980s

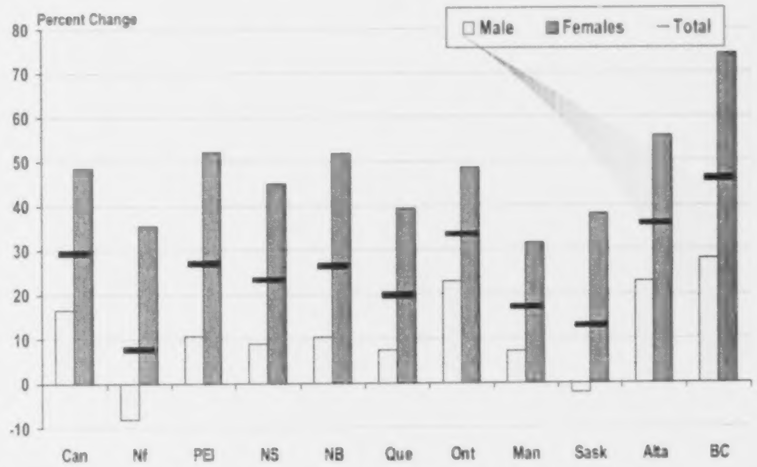


Declines have been much more than in proportion to declines in the size of the the youth population.

Economics & Statistics Branch, Department of Finance, Government of Newfoundland & Labrador 15

ECONOMIC FACTORS: Changes in Employment

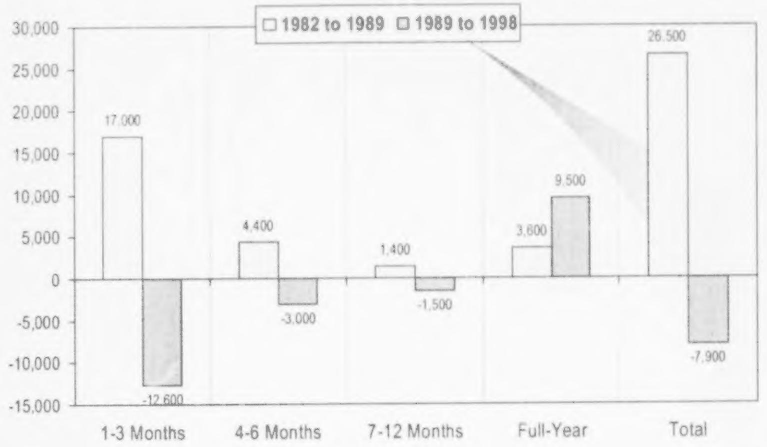
Canada and the Provinces 1980-1998



Economics & Statistics Branch, Department of Finance, Government of Newfoundland & Labrador 16

ECONOMIC FACTORS: Full/Part-Year Employment

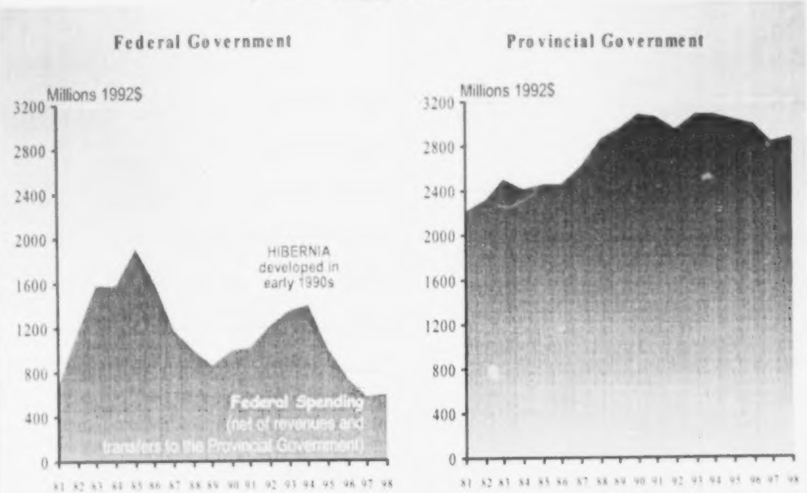
Change in Employment by Tenure:1980'S and 1990'S Newfoundland and Labrador



Government Programs & Policies

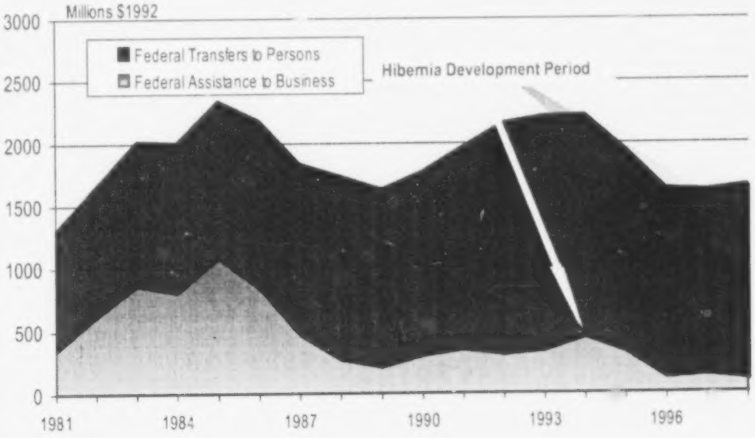
GOVERNMENT POLICIES AND PROGRAMS

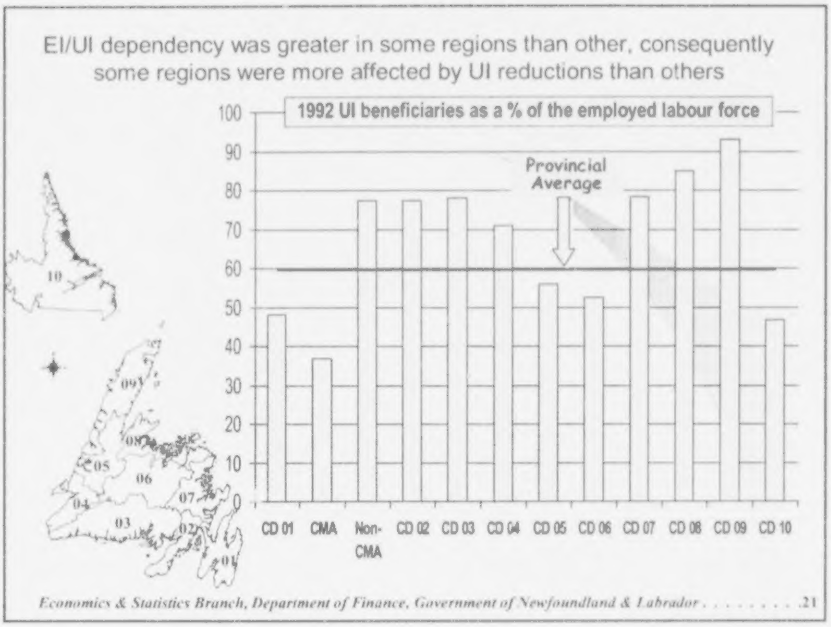
(Estimates exclude debt related items)



FEDERAL TRANSFERS PROVIDED SOME ASSISTANCE TO BUSINESS

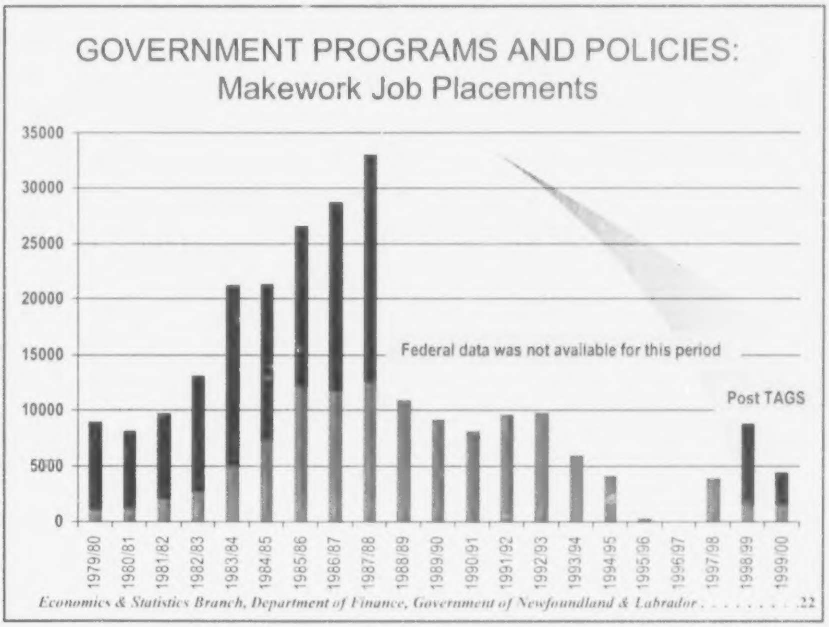
but the majority was transfers to persons (mainly EI/UI **benefits)**





EI/UI dependency was greater in some regions than other, consequently some regions were more affected by UI reductions than others

Economics & Statistics Branch, Department of Finance, Government of Newfoundland & Labrador 21



GOVERNMENT PROGRAMS AND POLICIES:
Makework Job Placements

Economics & Statistics Branch, Department of Finance, Government of Newfoundland & Labrador 22

Future Labour Market Requirements 1999 versus 2026

128,000 of the monthly average employment in 1999 were comprised of persons 35 years and up

- 150,000+ different people
- all 62+ by 2026 and most will be retired

Even with no employment growth, Province likely to need net in-migration to meet demand for workers over a one-generation projection period, otherwise employment would have to decline substantially.

Ken to address in his presentation

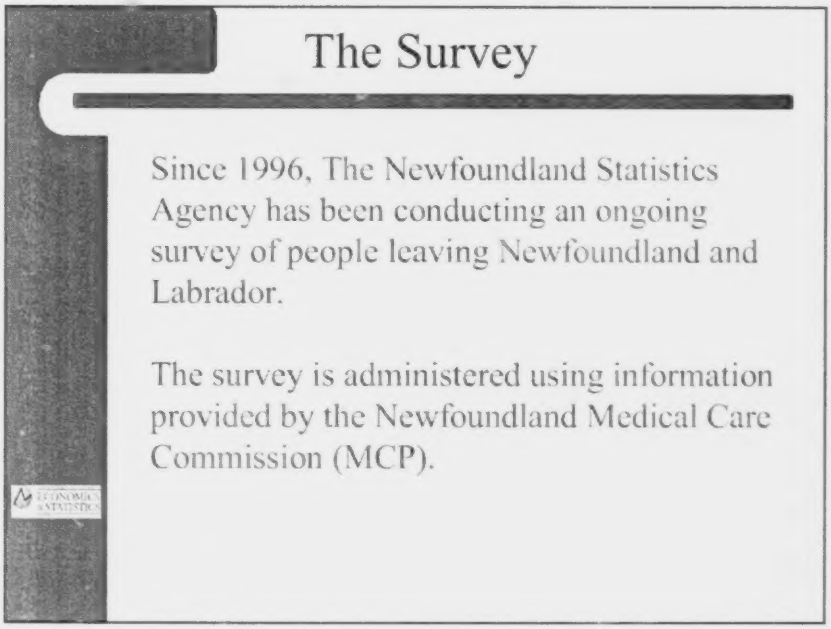
The Newfoundland and Labrador Survey of Out-Migrants

Selected Results

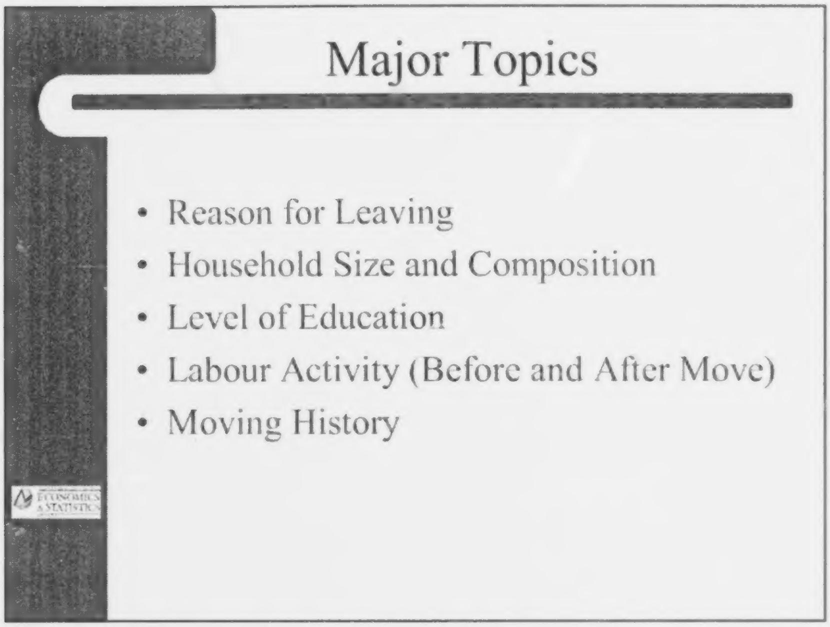
Panel of Experts - January 13, 2001



The Survey

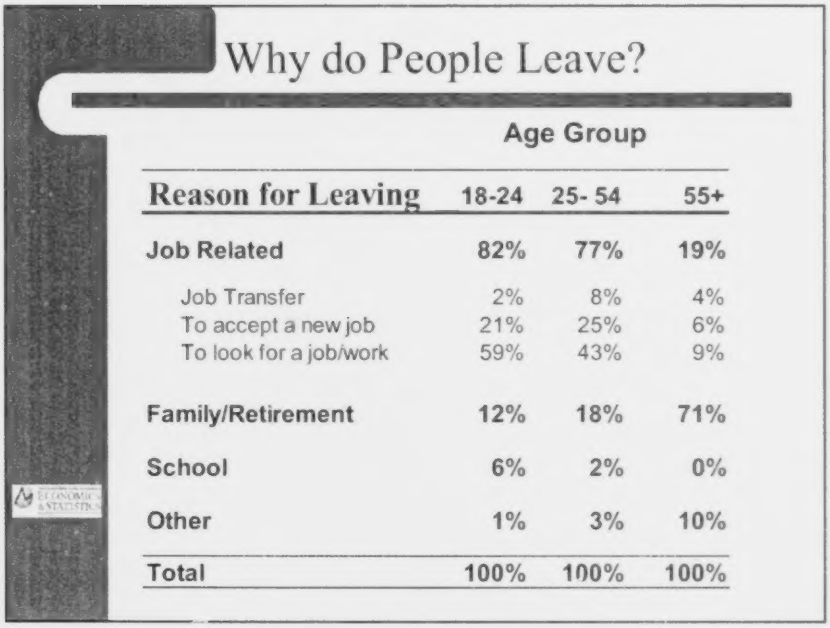
Since 1996, The Newfoundland Statistics Agency has been conducting an ongoing survey of people leaving Newfoundland and Labrador.

The survey is administered using information provided by the Newfoundland Medical Care Commission (MCP).



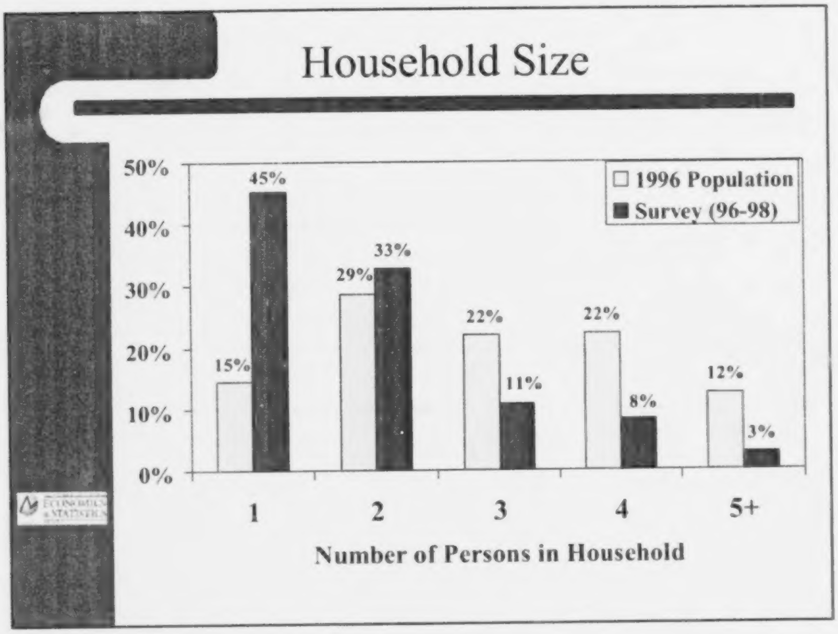
Major Topics

- Reason for Leaving
- Household Size and Composition
- Level of Education
- Labour Activity (Before and After Move)
- Moving History

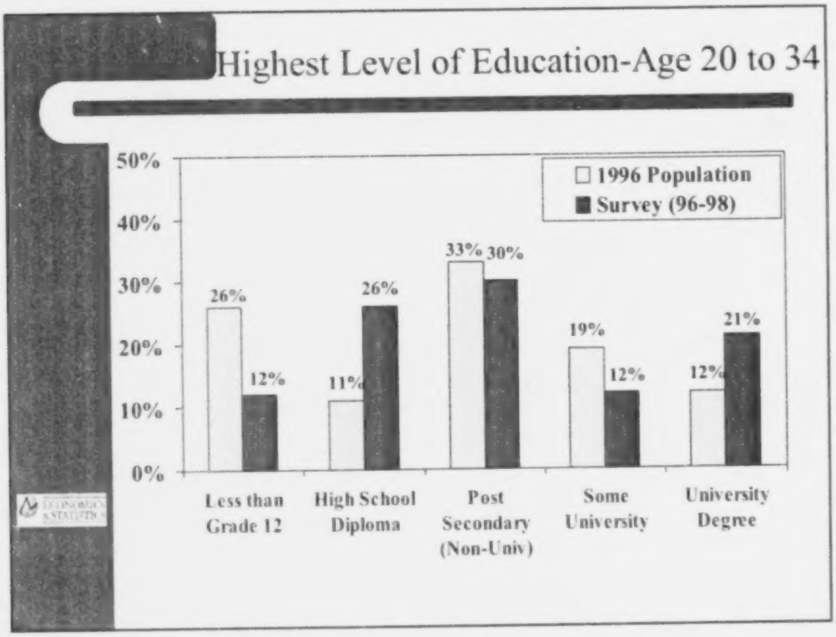


Why do People Leave?

	Age Group		
Reason for Leaving	18-24	25- 54	55+
Job Related	**82%**	**77%**	**19%**
Job Transfer	2%	8%	4%
To accept a new job	21%	25%	6%
To look for a job/work	59%	43%	9%
Family/Retirement	**12%**	**18%**	**71%**
School	**6%**	**2%**	**0%**
Other	**1%**	**3%**	**10%**
Total	**100%**	**100%**	**100%**

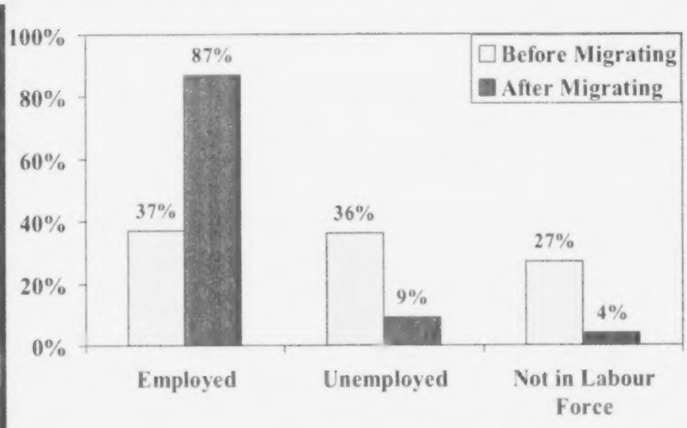


Household Size



Highest Level of Education-Age 20 to 34

Labour Force Status - Age 20 to 34

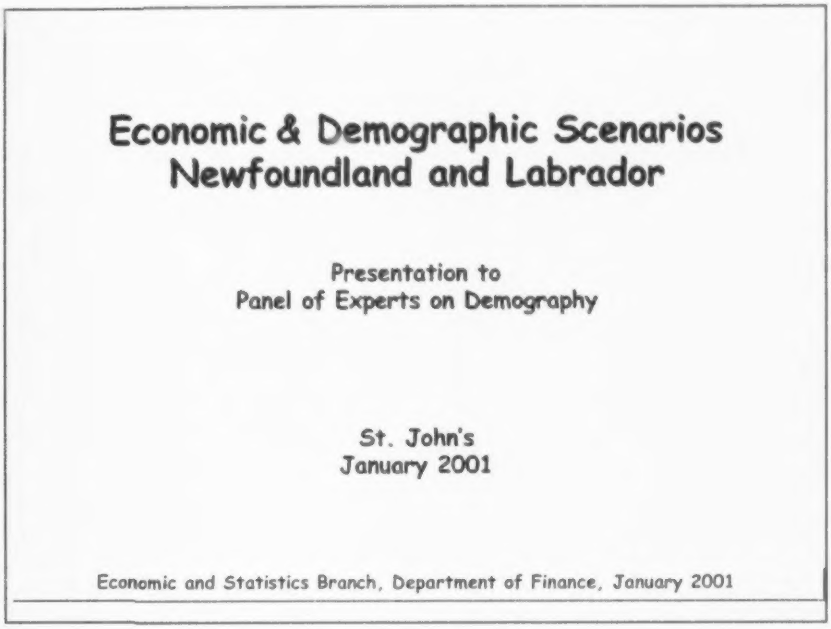


Other Findings from the Survey

- **24%** of migrants said children were included in their move
- **30%** of migrants said it was not the first time they moved from the province
- **83%** of migrants were born in the province

Future Directions

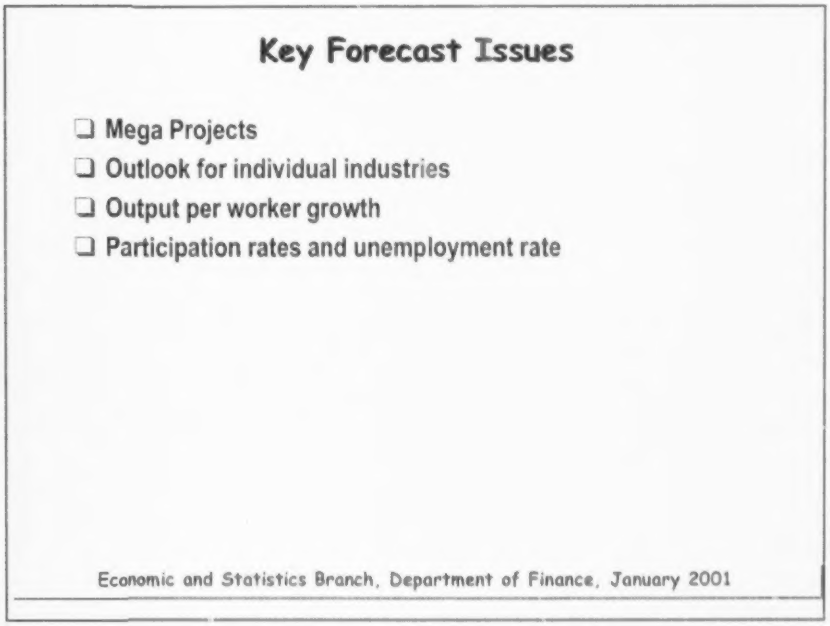
- Newfoundland Statistics will continue the Survey of Out-Migrants indefinitely
- Newfoundland Statistics and ACOA have begun work on a similar Survey of In-Migrants to the Province



Economic & Demographic Scenarios
Newfoundland and Labrador

Presentation to
Panel of Experts on Demography

St. John's
January 2001



Key Forecast Issues

- ☐ Mega Projects
- ☐ Outlook for individual industries
- ☐ Output per worker growth
- ☐ Participation rates and unemployment rate

Potential Mega Projects

Projects	LOW	MEDIUM	HIGH
Voisey's Bay	L[1]	M	H
Labrador Power		M	H
Terra Nova	L	M	H
Whiterose	L	M	H
Hebron/Ben Nevis		M	H
Undis. Oil 1		M	H
Undis. Oil 2			H
Gas Project		M[2]	H[3]

1. Surface ovoid portion only.
2. Starts in 2015.
3. Starts in 2011.

Economic and Statistics Branch, Department of Finance, January 2001

Major Industry Assumptions

Agriculture	Grows with local demand for products
Primary Forestry	Stable
Fish Harvesting	Slight increase: groundfish increase marginally, shellfish stable
Mining (excluding Voisey's Bay)	Stable
Fish Products	Slight increase with small increase in groundfish landings
Newsprint	Stable
Other Manufacturing	Grows in line with demand for products
Construction	Mega projects and core capital spending
Utilities	Stable
Trade	Grows in line with real consumer spending
Transportation Storage & Comm.	Grows in line with overall economic activity
FIRE	Grows in line with overall economic activity
Other Commercial Services	Grows in line with overall economic activity
Education	Declines, but at a slower rate than enrollment
Health & Social Services	Increases with real health care spending
Public Administration	Stable real spending

Appendix 6

Notes from a Presentation to Panel of Experts by Dr. Byron Spencer, McMaster University

on the POPulation Projection System (POPPS)

An Appendix to
LONG TERM POPULATION PROJECTIONS FOR
NEWFOUNDLAND AND LABRADOR:
A Consultative Approach
DRAFT #2 — Final Report

A Joint Project Between
Economics and Statistics Branch, Department of Finance
and
Planning and Coordination Division, Atlantic Canada Opportunities Agency
(November 2001)

Presentation to Panel of Experts

Dr. Byron Spencer presented on the POPPS model, a population projection and simulation program. The following points were made.

- The model simulates population change and labour market for regions.
- It also determines program expenditure implications.
- It is organized by various geographical boundaries including the Regional Economic Development Zones, health board regions, school board regions, census divisions and the province overall.
- Interval reporting can be chosen in the model by age groups and gender.
- The model can show the results in population pyramids.
- Dependency ratio tables, labour force participation rates are incorporated into the model.
- Labour force data at the regional level are based on tax filer data.
- There are default assumptions such as the fertility rate by Statistics Canada in 1997 in the model but these can be changed.
- Changes can be made on all assumptions such as mortality, migration, population adjustments, projected participation rates, and expenditure projections.
- Pyramids show that there was less of a boom showing in 1996 than in Canada but with the loss of youth by 2011 the boomers begin to be more prominent again.
- By 2026, the base of the pyramid becomes even narrower and takes on a spin top look.
- The baseline assumptions made for the model include the highest ratio of population to labour force, continued low fertility, continued out-migration.
- Based on these assumptions, POPPS shows a substantial decrease in population with a very large decrease in youth and a huge increase in the elderly.
- There is much more rapid aging in Newfoundland than Canada.
- A monthly and yearly basis was used for labour market participation rates.
- International migration in Newfoundland is very low; in 1999 the province had 0.22% of the country's in-migration.
- Almost all population flows are inter-provincial.
- There has been a long history of out-migration in the province and after a decade (2000 to 2010) of inflows and outflows, net migration goes to zero in the model by 2011.
- POPPS accounts for different migration rates by age group.

Discussion

- Statistics Canada is now using child benefit data to track migration.
- It appears that many families left in the late 1990s but it is expected that there will be a greater proportion of singles leaving in the future.
- Many young people are leaving the province, as they cannot enter the fishery since rehiring is being done on the basis of seniority and all older workers are being rehired in fish plants.
- Age specific in and out flows are required to compute population scenarios, out-migration can be calculated better than in-migration.
- Age cohort information is important in developing scenarios.
- There is a great deal of uncertainty about migration flows as they are unpredictable.
- Migration is the one that we know the least about but it is becoming more and more important.
- The planning process requires more attention paid to the uncertainties.
- Planning needs to be more robust rather than less so.
- Planning should be on-going for infrastructure with new infrastructure possibly designed to have greater mobility and flexibility.
- It appears older seniors move to become closer to services such as health care and seniors homes.
- Questions include: Who bears the cost where migrants go? Should Newfoundland bear the cost of demographic change?
- Providing high, medium and low best way to plan.
- All scenarios lead in the same direction, urbanization and intra-provincial migration.

Panel of Experts Consultation Notes

A *Panel of Experts* was convened to provide a non-binding review of total population projections for Newfoundland and Labrador. The *Panel* was coordinated and chaired by Dr. Doug May. Its make-up was jointly agreed upon between ACOA and Provincial Finance, but determined in consultation with and on the recommendation of Dr. May. The *Panel of Experts* was convened in St John's, Newfoundland on January 13 and 14, 2001. Its make-up was as follows:

Attendance at the Panel of Experts Session

Academic Panel[1]	*Provincial Finance (E&SB)*	*Federal ACOA*
Dr. Doug May (MUN), Chair	Bev Carter (Presenter)	Don Hogan (Presenter)
Dr. Dane Rowlands (Carleton U)	Alton Hollett	Paul Parsons
Dr. Roy West (MUN Medical)	Rod Forsey	*Conference Board of Canada*
Dr. Stan Winer (Ottawa U)	Ken Hicks (Presenter)	Mario Lefebvre (Regional Unit)
Dr. Byron Spencer (McMasters U)	Linda Bartholomew (Presenter)	*Statistics Canada*
	Patti Powers	Francois Nault (Demography Unit)

[1] Biographies for the panel are provided in Appendix 4.

The three economic/demographic scenarios, together with the major underlying assumptions, formed the basis of the federal/provincial presentations to the *Panel of Experts* which was convened in St John's, Newfoundland on January 13 and 14, 2001. The *Panel* was asked to review economic and demographic scenarios, including their underlying assumptions, as well as the methodology employed to develop the three population scenarios. The Panel discussions were facilitated by Dr. Doug May, project coordinator. Copies of all presentations are contained in Appendix 5, in the order in which they were presented.

Natural Population Change — Presentation

Bev Carter made the first presentation to the Panel. The presentation opened with a brief introduction outlining the important impacts that factors such as the collapse of the groundfish industry, the heavy dependency on UI prior to the collapse and the significant changes to EI, and government restraint have had on demographic changes in the province. In particular, these economic and policy changes have lead to an increase in out-migration. Between 1993, peak year, and 2000, the province's population has dropped by 7 percent. It was also noted that population growth had historically be relatively slow in Newfoundland compared to Canada, and that out-migration was not a phenomenon that began with the 1990s.

While out-migration has been a significant factor in population decline, changes in the rate of natural population growth have also been important. In particular, changes in the number of births in the province are having a major impact on demographics. See Appendix 5 for presentation charts which provide an overview of the presentation.

Discussion

Considerable discussion ensued and several key points were noted. One key point was that stability of employment and income was thought to be an important factor in fertility rates. For instance, a study printed in the *Journal of Economic Perspectives* (Fall 2000) reported that fertility rates in 53 countries decreased proportionally to the number of women earning wages. This certainly confirms the view that rising participation rates have contributed to declining and low fertility rates in the Province. It was also noted that women are increasingly delaying childbearing, as they pursue education and careers, and this results in fewer children.

It was suggested that the province needed to collect information about the fertility behaviour of migrants. For instance, are women leaving and having more children because of stable incomes elsewhere; are they staying because they want to have less children; do Newfoundland women elsewhere have a lower fertility rate; if there are good jobs for men, are women more likely to have more children?

Insofar as the purpose of this consultation was concerned, none of the Panel members took issue with the assumptions that had been made concerning fertility and mortality rates. It was generally agreed that these assumptions were reasonable, and that they did not differ significantly from those being made by other non-government agents.

Population Projection System (POPPS) — Presentation

Dr. Byron Spencer, one of the Panel members, presented on the POPPS model which he and Dr. Frank Denton built for the province as part of its *Demographic Study*. The model simulates population change and labour markets for various regions within the province (e.g., total province, economic zones, education/health regions, etc.), accounting for different migration rates by age. It aso determines *constant quality* program expenditure implications of demographic changes. Notes on this presentation are provided in Appendix 6.

Discussion

Dr. Spencer did present a population scenario, using the POPPS model's default assumptions. Most of the discussion which followed his presentation of the model centered on migration. It was noted that while migration is becoming increasingly important to the province, it is the one that we know the least about.

It appears older seniors move to become closer to services such as health care and seniors homes. It also appears that many families left in the late 1990s but it is expected that there will be a greater proportion of singles leaving in the future. Many young people are leaving the province. This is partly because they cannot enter the fishery since rehiring is being done on the basis of seniority and this means that it is mainly older workers that are being re/hired in fish plants.

It was noted that while out-migration can be calculated better than in-migration, age specific in and out flows are required to compute population scenarios. Planning should be on-going for infrastructure with new infrastructure possibly designed to have greater mobility and flexibility in the face of volatile demographics.

The panel felt that providing high, medium and low scenarios was best way to plan. It also felt that all scenarios lead in the same direction — urbanization and intra-provincial migration.

Statistics Canada mentioned that they adjust residual migration rates by region as the province does. It also mentioned that males 20 to 29 years of age are hard to enumerate in the census and tax filer data, as they are very mobile. The number captured varies by sources of information used. It was also noted that female migration rates trickle off by the ages of 25 to 29 years of age.

Regional Patterns in Births, Fertility Rates and Deaths — Presentation

Linda Bartholomew (Newfoundland Statistics Agency) made a presentation before the Panel on this topic. The main point is that there is little difference in fertility rates across economic zones. Virtually all zones had experienced declining births and rising deaths. Labrador was a major exception to *demographic rules of thumb*. It is quite different from the rest of the province because of a small population, large areas with mainly an Aboriginal population, affluence in the West because of iron ore mining and Central that has many more immigrants. Births have been declining in all regions of the province, with larger declines noted in those regions that had recorded significant out-migration of young people. Deaths have been rising in all regions because of aging.

Discussion

Women delaying child bearing until after the age of 30 years may make it more difficult to conceive, but doesn't explain the differences between Newfoundland and Canada. It was also noted that young, healthy, fit women have a slightly higher miscarriage rate. Surveys have found the preferred number of children is two, and having one child (or none at all) is becoming a more popular choice.

Fertility and Mortality Issues — Presentation

Dr. Roy West made a presentation before the Panel on this topic. He noted that the average life expectancy (from birth) is now in the 80-85 year range, and that improvements on this range are likely to come very slowly and at high cost in the future. Infant mortality has declined to almost nil. He also noted that the fertility rate has become a determinant of health issue, and thought that the rate might rebound somewhat if economic conditions improved, however, increasing fertility rates is a very long-term answer to declining populations. In-migration is the quick answer. Overall, Dr. West felt mortality assumptions are fairly straight forward as little can be done to increase life expectancy much further. Fertility can be influenced by public policy such as supporting parents who do not work.

Discussion

The discussion centered around the fertility and mortality (i.e., life expectancy) rate assumptions used by the various agencies. These rates were as follows:

Fertility Rates

Nfld.	Statistics Canada	POPPS Default	Conference Board
1997	1.269	1.269	1.269
2016	(1.46) 1.26 [1.17]	1.269	1.269
2026	(1.60) 1.30 [1.17]	1.269	1.269

Notes: ( ) high scenario, [ ] low scenario

- Canadian high scenario is 1.8, lower than the US rate. The 1996 rate was 1.3 in Germany and 1.28 in Italy.

Mortality Rates

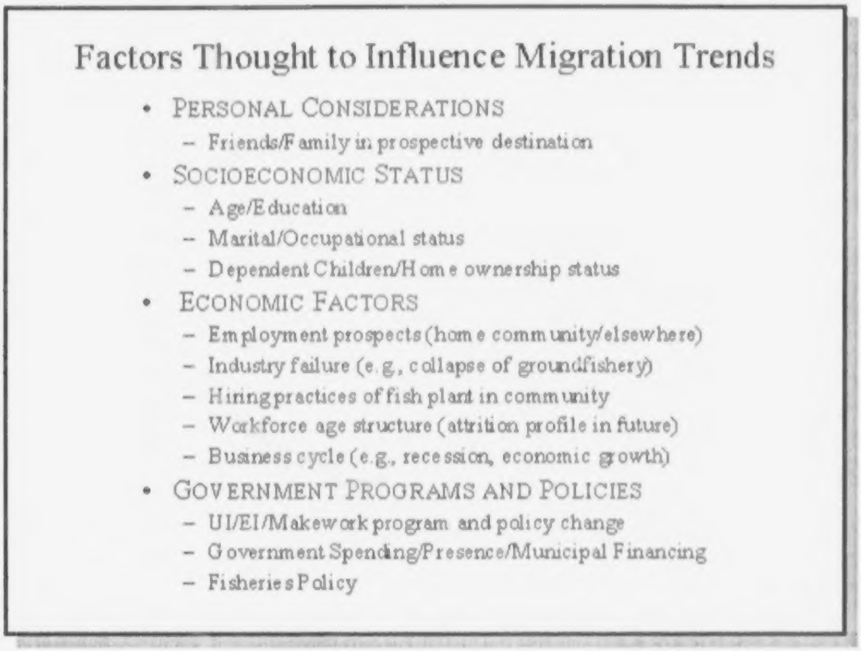
	Statistics Canada		POPPS Default		Conference Board	
	M	F	M	F	M	F
1996 Canada	75.7	81.2				
1996 NFLD	74.4	80.2	74.4	80.2		
2016 NFLD	(80.4) 78.7 [77.5]	(83.9) 82.9 [82.0]	77.1	81.7	78.7	82.9
2016 Canada	80.0	84.0				

Notes: ( ) high scenario, [ ] low scenario

It was noted that both the fertility and mortality rates which the Province used to develop its population projections were very much in the same ball park as the others. There was some discussion of factors which could influence these rates including more jobs and higher income patterns for women, which could mean lower fertility rates.

Migration as a Component of Population Change — Presentation

Bev Carter provided a presentation on this topic. The following chart provided the framework for the presentation and discussion which followed.



Factors Thought to Influence Migration Trends

- PERSONAL CONSIDERATIONS
  - Friends/Family in prospective destination
- SOCIOECONOMIC STATUS
  - Age/Education
  - Marital/Occupational status
  - Dependent Children/Home ownership status
- ECONOMIC FACTORS
  - Employment prospects (home community/elsewhere)
  - Industry failure (e.g., collapse of groundfishery)
  - Hiring practices of fish plant in community
  - Workforce age structure (attrition profile in future)
  - Business cycle (e.g., recession, economic growth)
- GOVERNMENT PROGRAMS AND POLICIES
  - UI/EI/Makework program and policy change
  - Government Spending/Presence/Municipal Financing
  - Fisheries Policy

It was noted that out-migration is nothing new to Newfoundland and Labradro, having averaged 3,700 per year during the 1970s and 1980s. It was also noted that economic change can be observed in the migration trends. There are a number of factors thought to influence choices people make to migrate, as outlined in the chart above, and each was discussed with reference to the related charts contained in Appendix 5. It was noted that the data suggests future labour market requirements may be driven by retirements as well as some job growth. By 2026, it is projected 128,000 workers will retire. In-migration will be needed to fill these job vacancies.

In summary, both out-migration and natural population change have contributed to declining population. The highest decline in population began in 1993 and appears to be subsiding in 2000/01 as migration slows down.

Discussion

There was considerable discussion around the topic of migration following the presentation and at earlier and later points during the two day session. Most of the discussion served to reinforce points made in the presentation and also to emphasize the importance of more and better measures of migration.

Out-Migration Survey Results — Presentation

Linda Bartholomew provided a presentation on the results of the migration survey the Newfoundland Statistics Agency has been conducting in conjunction with the Newfoundland Medical Care Commission (MCP). She noted that the survey is basically confirming what the migration data shows and/or what most people believe about out-migrants. That is, most out-migrants leave for job related reasons, are single, have no children and are fairly well educated.

Discussion

There was little discussion of this presentation since many of the points raised had come up in other discussions.

In-Migration: Gross Flows — Presentation

This presentation was made by Ken Hicks, who noted that there was some suggestion in the data that a large part of in-migration was, in fact, return migrants although it could not be said with 100% certainty. He also noted that the real migration story for Newfoundland is interprovincial, with other flows being fairly small in most years, partly because the province's unemployment rate has consistently been high relative to Canada's and thus international immigrants have historically been more attracted to other parts of the country.

In the period from 1976 to 2000, Newfoundland & Labrador has had an oversupply of labour as witnessed by high unemployment rates, low participation rates and high out-migration. One of the major reasons for the oversupply of labour was that during the 25 years from 1976 to 2000 the age cohorts leaving the labour force were much smaller than those moving in to replace them. Looking at labour supply, in 1976, there were nearly 270,000 people between the ages of 10 and 34 and only about 120,000 between the ages of 35 to 59. So basically over the last 25 years we had roughly 120,000 people leaving prime labour force age and 270,000 people coming behind to replace them. There simply weren't enough jobs to go around.

In the coming years, this situation will be reversed, with more people leaving the labour force than the numbers that will be available to replace them. If the number of jobs in the economy remains constant over the next 25 years nearly 127,600 replacement positions will need to be filled, not to mention any new jobs that might open up due to economic growth. In order to meet this demand for workers, there must be net in-migration. Otherwise huge labour shortages will develop.

Factors Underlying Interprovincial Migration — Presentation

Dr. Stanley Winer presented the results of his and Dr. Kathleen Day's research on this topic using tax filer data (a 10% sample) from 1974 onwards. He noted that, according to their research, the costs of moving (i.e., social, economic or monetary, emotional and psychological) presented the greatest barrier to migration.

Discussion

Quite a lengthy discussion followed. The main points which arose were as follows:

- There is a residual adjustment on migration of approximately 1,700 per year between 1991 and 1996 (off by 1,700 x 5 over the 5 years).
- Residual adjustment mostly affects Newfoundland and B.C.
- Statistics Canada underestimates net out-migration and, therefore, over-estimates population size. It is a country consistency issue.
- The aging trends in Newfoundland are more exaggerated than the rest of the country.
- It would be useful to compare the Newfoundland data with what is happening in the rest of the country to see how much different Newfoundland is in its aging trends.
- It was noted that many factors in the Winer/Day model may not be important to people migrating from Newfoundland during the 1990s. It was suggested Craig Riddell's research on tracking tax filers when the EI regulations were changed might be helpful in understanding what went on during the northern cod moratorium.

Consultations and Regional Economic Trends — Presentation

Don Hogan provided a brief overview of the Regional Consultations, and highlighted some of the main themes which emerged. There was little discussion of the regional detail

Economic and Demographic Scenarios — Presentation

Ken Hicks presented the three (High, Medium & Low) economic scenarios which had been developed for the project, along with the implications of the economics for the demographic projections and changing industry labour demands. He explained the *"what would happen if"* nature of the economic/demographic scenarios, based upon a set of assumptions agreed upon between ACOA and NF Finance. He also explained that the key issues related to the economic forecast are: mega project assumptions, outlook for individual industries, output per worker and real wage growth assumptions for individual industries, population levels, age/gender specific participation rate assumptions and unemployment rate assumptions

The economic projections were developed using the Newfoundland and Labrador Econometric Model (NALEM) and the ACOA/NF Finance agreed upon assumptions. NALEM is essential a neo-classical Keynesian synthesis where real GDP is modeled on an expenditure basis, but limited by capital stock constraints and, to some degree, by labour supply constraints. However, most of the export components of final demand are determined by local resource constraints and are essentially exogenous. The service sector type demands run off population and income.

The various combinations of key assumptions produced three economic scenarios with differing labour force and thus population requirements in 2025, and thus different population outcomes.

The demographic scenarios were developed by choosing three total fertility rate assumptions, three life expectancy assumptions and combining these with the economic scenarios. Through an iterative process between POPPS and NALEM the population projections and the economic projections were adjusted back and forth, via net-migration in POPPS and via total population in NALEM, until the two were consistent with each other.

The results of the projections showed that labour requirements are very sensitive to output per worker assumptions and participation rate assumptions. The resulting population projections for 2025 (the end year was changed to 2016 following the consultation) were:

Low: 466,300 Medium: 515,300 High: 540,600.

All three scenarios show a shifting of employment shares towards the service sector.

Discussion

Captured elsewhere in this section of the report, and therefore not repeated here. Basically, there was a lot of overlap between the discussions.

Panel Discussion and Reaction to Presentations

Francois Nault, Statistics Canada

Mr. Nault reviewed Statistics Canada's latest demographic projections for Newfoundland and Labrador, and highlighted the main assumptions. He noted that their projections are largely based on historical trends, although they do consult with the provinces on the assumptions. He also noted that their projections for all provinces are constrained to add to the totals for Canada. Statistics Canada's latest three demographic projections for the province are not significantly different from those presented to the panel.

Mario Lefebvre, Conference Board of Canada

Conference Board's latest population projections for the Province differ quite a bit from those presented, however, they will likely change when their long term forecast is revised. The Conference Board does use equations in their macroeconomic model to try and capture migration, but does not have the capability to do detailed age/sex demographic analysis.

Dr. Byron Spencer, McMasters University (Co-Author of the AIMS Report)

Dr. Spencer voiced some concern about using the NALEM model for long term economic forecasting (i.e., to 2025), suggesting it should be restricted to the medium term (i.e., up to about 10 or 15 years). He did indicate, however, that he thought the one projection (medium scenario) that had been presented to the Panel was reasonable. He suggested that it would be instructive to assess the implications of continued traditional rates of out-migration i.e., about 3,700/year and what that would mean for labour markets and GDP output. This recognized that the province's scenario for net in-migration assumed that labour demands would be met, but asked the question *"What if the labour demands are not met?"*

Dr. Stan Winer, Ottawa University

Dr. Winer shared Dr. Spencer's concern about the use of the NALEM model for long term forecasting, but felt that

NALEM was advantageous in that it forced consistency among the various indicators in the outlook. However, he felt that, as the uncertainty increases the further out you go, it might be better to focus on the next 5-10 years instead of a full generation (i.e., 26 years).

He thought it might be helpful to think about the issues in a simpler way, by modeling long term labour supply in the first instance, and then allowing demand for labour to adjust to that. He also thought it would be instructive to develop a scenario whereby Newfoundland becomes a dynamic economy as in the Irish model.

Dr. Dane Rowlands, Carleton University

Dr. Rowlands felt that a reasonable argument can be made that Newfoundland may be on a cusp and that labour markets will tighten up earlier in this province, however, information on what is likely to happen in the rest of the country is necessary. He also indicated he was uncomfortable seeing in-migration after years of out-migration.

The urban to rural shift of population is important to consider. The dynamic dimension of this is that people move to urban areas, find no jobs and leave. Are urban areas gathering and keeping people or are they moving on? Another dynamic social component is when people leave their rural ties are they likely to move again. Need to assess whether urbanization will continue.

Historical job prospects are very important. The population is getting older and youth are becoming educated. Youth may be less willing to accept the low wages of jobs in resource sector and may become more mobile.

Dr. Roy West, MUN School of Medicine

Dr. West focused mainly on fertility and mortality rates, as well as general health policy issues, although he did express the view that some serious consideration needed to be given to what to do about rural communities. He felt it was unlikely there would be any changes in the fertility rate, and even if there were, it would not have any short term effects on population.

General Discussion

The academic members of the panel questioned whether or not the NALEM model was the best tool for analyzing long term demographic trends in the Province, and also whether or not net in-migration to meet future labour market requirements was a reasonable expectation given historical trends. Some members felt it would be important to consider the implications of this not occurring (i.e., the in-migration needed under the economic scenarios presented), and thought it would be important to study how labour markets respond to shortages.[1] The likelihood of ongoing urbanization, given aging of the population and the fact that people are often much less likely to move once they pass 40, should also be studied.

Wage rate patterns of the past will not likely continue in the future. The province has remained competitive due to the low wage rates although inefficient in the presence of social and economic development policies aimed at maintaining status quo. If the province is to compete in the future, there will need to be convergence in productivity and wage rates as the labour market tightens up.

During the discussion the Province maintained its confidence in the NALEM model as an analytical tool to be used in conjunction with the POPPS model, noting that it had been reviewed by Federal Finance a few years ago in connection with some joint work and met with that federal Department's approval. The province also maintained the view (i.e., assumption), agreed upon between ACOA/NF Finance when details of the projections were being worked out, that net in-migration would occur if jobs were available and wages were competitive with other parts of Canada. A key determinant of past out-migration was a shortage of jobs in relation to the number (or potential number) of new labour market entrants. This will not be an issue in the future due to attrition as current, aging workers begin to retire in large numbers. Any net employment growth would only add to the attrition-related demand for workers.

---

[1] It is noted that apart from Dr. May, none of the members of the Panel of Experts had worked with the NALEM model or reviewed any of its documentation. It is also noted that the purpose of the project was to develop *"what would happen if"* scenarios (and not *"view of the world"* scenarios) under an ACOA/NF Finance agreed upon set of assumptions. Labour demands not being met was not one of the agreed upon assumptions, though it might be worth considering in future work with a different purpose

The underlying assumptions and projections are reasonable *"what would happen if scenario"*, as called for by the proposal, and this is confirmed by the regional consultations and the related population projections. The economic/demographic projections are based on participation rates approaching, though not reaching because of seasonality of employment, national levels. They also include fairly low unemployment rate assumptions and assume assume fairly strong productivity growth that would see productivity levels in this province at, or above in some cases, national levels.

Both Statistics Canada and the Conference Board of Canada felt the province's analysis and projections were reasonable. Moreover, it is noted that while the formal consultation took place in January 2001, informal discussions with the agencies represented began a year or more prior to that. The projections, and hence demographic views, of both Statistics Canada and the Conference Board of Canada much more closely approximate the province's now that they did a year ago, as illustrated in Appendix 11.

Appendix 11

Demographic Projections: Then and Now

Population Projections by Statistics Canada and the Conference Board of Canada

An Appendix to
LONG TERM POPULATION PROJECTIONS FOR
NEWFOUNDLAND AND LABRADOR:
A Consultative Approach
DRAFT #2 — Final Report

A Joint Project Between
Economics and Statistics Branch, Department of Finance
and
Planning and Coordination Division, Atlantic Canada Opportunities Agency
(November 2001)

Other Agency's Population Projections

Several agencies produce population projections for Newfoundland and Labrador. Among them are Statistics Canada, the Atlantic Institute for Market Studies, and the Conference Board of Canada. In the past, many of the projections by these agencies were produced by simply extrapolating past fertility, mortality and migration trends. Some predicted dramatic declines in Newfoundland and Labrador's population and as a result often garnered significant negative media attention. The major problem with doing population projections in this manner is the failure to take into account future economic conditions and the resulting labour demand/supply dynamics. Simply extrapolations of past trends, particularly migration trends, can produce unrealistic results because past trends were the result of very different labour demand/supply conditions than can be expected for Newfoundland and Labrador in the coming years.

Throughout the past 30 years, Newfoundland and Labrador has lost a significant number of people to out-migration, but its labour force has continued to grow, mainly because the younger population cohorts entering the labour force were much larger than the older cohorts retiring. In the coming years, however, the opposite will be true. The large cohorts of baby boomers reaching retirement age over the next 16 years will soon outnumber the number of new entrants creating huge gap between replacement demand for labour and new supply.

Even if Newfoundland and Labrador's employment remained at 2000 levels and the unemployment rate declined to ten percent by 2016 we will still require a labour force of roughly 228,000. Some of the gap between the number of retirees and the number of new entrants can be made up by higher participation rates. However, allowing Newfoundland's age specific labour force participation rates to increase by half the current gap with Canadian rates will still require a population of roughly 515,000 in 2016 to supply a labour force of 228,000. If employment grows over the next 16 years the extra labour demand would have to be made up through one or some combination of the following: a lower unemployment rate, higher participation rates for higher population levels. Contrast this with Statistics Canada's September 1999 low projection which projected a total population of 454,000 in 2016. For such a scenario to fit future labour market conditions would require much higher participation rates, a lower unemployment rate and declines in employment over the next 16 years.

In recent years the Department of Finance has been in consultation with these agencies pointing out the inconsistencies between very low population projections and future labour requirements. More recent projections from Statistics Canad and the Conference Board of Canada have been revised upward and are much closer to the Department of Finance projections. The following tables show population projections published by Statistics Canada, the Atlantic Institute for Market Studies (AIMS) and the Conference Board of Canada and, where available, how the projections have changed in recent years.

Projection 3 - Fertility (high); Mortality (high); Internal Migration (west); Immigration (high)

Projection 4 - Fertility (high); Mortality (high); Internal Migration (central); Immigration (high)

1. Central in September 1999, Medium in March 2001.

West Scenario: Westward migration, mainly to British Columbia, Alberta, Yukon, Northwest Territories and Nunavut. Also, favourable to the Atlantic provinces.

Central Scenario: Most favourable scenario for Quebec, Ontario, Manitoba and Saskatchewan.

Medium Scenario: Average of Central and West Scenarios.
